

Overview & Methodology

Since August 2017, an estimated 727,000 Rohingya refugees have arrived in Bangladesh's Cox's Bazar District from Myanmar, bringing the total number residing in Bangladesh to approximately 921,000.¹ The unplanned and spontaneous nature of the post-August Rohingya refugee camps have combined with high population densities and challenging environmental conditions to produce a crisis with especially acute water, sanitation and hygiene (WASH) needs.

In April 2018, REACH undertook a WASH household assessment in the framework of the Cox's Bazar WASH Sector with UNICEF support, which established a baseline for WASH conditions and perceptions amongst Rohingya refugee communities in Cox's Bazar District. Between August and October 2018, REACH undertook this follow-up assessment, taking the form of a household survey covering 33 out of the 34 Inter Sector Coordination Group-recognized camps, with Kutupalong RC the only exception due to ongoing security concerns. Due to issues surrounding access, enumerators were able to access some of the camps only intermittently between 12 and 26 September 2018.

This follow-up assessment aims to understand changing WASH conditions across the Rohingya refugee camps since April 2018, and where possible understand the impact of the monsoon season, to inform priority areas and types of humanitarian programming. Results of this follow-up assessment are generalizable at the camp level with a 95% confidence level and a 10% margin of error. The method of identifying heads of households as primary respondents in the baseline survey resulted in a low proportion of female respondents. To address this limitation, this follow-up survey required enumerators to interview refugees of the same gender only. As a result, menstrual hygiene indicators are not included in camp-level factsheets, due to an insufficient number of females having been interviewed to yield generalizable results, however these indicators are included in the all-camp summary factsheet. **This factsheet presents an analysis of data collected within Camp 24, where 96 households were surveyed,² as well as an indicator comparison table displaying changes in WASH conditions between the baseline and follow-up assessments.**

Enumerator training took place prior to the start of data collection, including sessions on testing for residual chlorine run by the Centre for Disease Control, as well as Prevention of Sexual Exploitation and Abuse (PSEA) run by UNHCR. Support for questionnaire translation from English to Rohingya language and enumerator language training was provided by Translators Without Borders.

As part of this assessment, 33 camp-level factsheets and one all-camps summary factsheet display key findings from the survey. All REACH products, including those related to the baseline assessment, are available on the [REACH Resource Centre](#). In addition, all datasets are available on [Humanitarian Data Exchange](#), while all factsheets and maps are available on [HumanitarianResponse](#).

Demographics

Population in camp (individuals) ³	33,731
Population in camp (families) ³	7,804
Average age of respondent	34
Average household size	5.2

Composition of surveyed households

% of households reporting different levels of overall satisfaction with water, sanitation and hygiene

Very satisfied	0%	
Satisfied	83%	<div style="width: 83%;"></div>
Unsatisfied	17%	<div style="width: 17%;"></div>
Very unsatisfied	0%	

¹Inter Sector Coordination Group Situation Report Data Summary (27 September, 2018). See: <https://bit.ly/2D36vx5>

²Please note that 7 surveys from Camp 24 contained water container measurement outliers and were excluded from data analysis, to avoid skewing data. This had a marginal effect on the margin of error for Camp 24 (95/10.33).

³Due to relocations of refugees to extension camps occurring at the time of assessment, population numbers for Camp 4 Extension and Camp 20 Extension were derived from the UNHCR Family Counting August 15, 2018 dataset, while population numbers for the remaining 31 camps surveyed were derived from the July 15, 2018 dataset. This assessment considers a household a 'family' as defined in the UNHCR Family Counting datasets.

Water

Water access

% of households reporting primary water sources for drinking water⁴

Primary drinking water sources	
✓ Improved water sources	100%
Tubewells/boreholes/handpump	33%
Tapstand	58%
Protected dugwell	0%
Protected spring	0%
Cart with small tank/drum	0%
Tanker truck	0%
Water tank	9%
Rainwater collection	0%
Bottled water	0%
x Unimproved water sources	0%
Unprotected dugwell	0%
Unprotected spring	0%
Surface water	0%

% of households reporting household members that normally collect water

% of households reporting different problems with accessing water⁷

% of households reporting changes in access to water compared to before the monsoon season

Water collection and storage

Average amount of water collected by households⁸

	Drinking water	Non-drinking water	All domestic water
Average litres collected per person, per day for each household	4L	4L	8L

% of containers within households that were:

⁴Cox's Bazar WASH Sector considers 'improved' water sources as listed

⁵There were no significant differences in responses from females and males

⁶SDG JMP standard for combined travel time to/waiting time at water source:

30 minutes or less: See: <https://bit.ly/2ONrjQg>

⁷Respondents could select multiple options

⁸Respondents were asked to present all water containers used to collect water the day prior to the survey, then identified which containers are used for drinking water, non-drinking water, or both. All containers were measured with tape measures to determine approximate volume.

⁹SPHERE minimum standard for all domestic water: 15 litres/person/day

See: <https://bit.ly/UKcX1Z>

¹⁰SPHERE minimum standard for drinking water: 2.5 - 3 litres/person/day:

See: <https://bit.ly/UKcX1Z>

% of households reporting using types of containers used for all domestic water^{11,12}

- 1** Aluminium pitcher **100%**
- 2** Bucket **47%**
- 3** Plastic container **10%**

% of households reporting duration of all domestic water storage within the household

Less than one day	87%	<div style="width: 87%;"></div>
1-2 days	12%	<div style="width: 12%;"></div>
3-4 days	1%	<div style="width: 1%;"></div>
5 days or more	0%	

% of containers tested for chlorine returning chlorine residual (c/r) values¹³

3 c/r	2 c/r	1.5 c/r	1 c/r	.6 c/r	.3 c/r	0.1 c/r	0.0 c/r
0%	0%	0%	0%	0%	1%	9%	90%

4% of households reported witnessing someone treating water with chlorine the last time they were at a waterpoint¹⁴

46% of households reported normally treating water before drinking

% of households reporting using types of water treatments^{11,15}

- 1** Cloth filters **36%**
- 2** Aquatabs **21%**
- 3** Boiling **2%**

% of households reporting reasons for not using aquatabs¹⁶

- 1** Never received aquatabs **51%**
- 2** Water from tapstand is already chlorinated **20%**
- 3** Supply of aquatabs ran out **19%**

Coping strategies

13% of households reported facing problems accessing water in the month prior to data collection

% of households reporting employing different coping strategies to compensate for water insufficiency in the month prior to data collection^{11,17}

- 1** Use a source that is further away **12%**
- 2** Use surface water for drinking water **2%**
- 3** Send children to collect water **2%**

Sanitation

Defecation and latrines

% of households reporting different household members normally defecating in different spaces

Places of defecation	Females ≥5	Males ≥5	Children <5
Communal/public latrines	66%	69%	25%
At facilities (e.g. school, clinic)	0%	0%	0%
Single household latrine (self-made)	0%	0%	0%
Single household latrine (non-self made)	12%	10%	4%
Shared household latrine (self-made)	8%	8%	2%
Shared household latrine (non-self made)	14%	13%	0%
Open defecation	0%	0%	40%
Bucket	0%	0%	27%
Other	0%	0%	2%

81% of households reported presence of soap the last time they were at the latrine

% of households reporting women and men facing problems with accessing latrines

Women 29%

20%

Men

¹¹ Respondents could select multiple options

¹² Three most common types of water containers for all domestic purposes are shown

¹³ Enumerators tested water for chlorine with pool testers in containers where respondents reported using the container for collecting drinking water. 145 out of 224 total water containers were tested for chlorine across within Camp 24

¹⁴ This indicator relates to an initiative in camps where volunteers or staff assist people put chlorine in their water containers when at a waterpoint

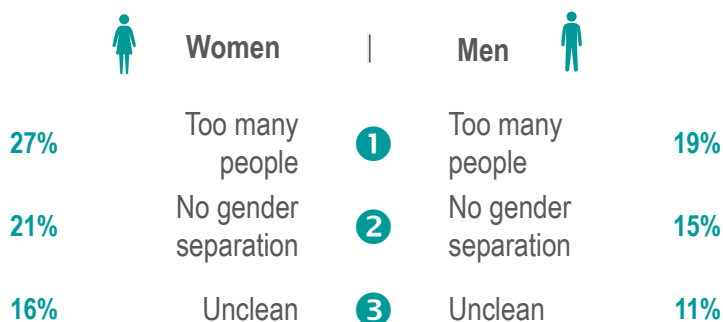

¹⁵ Three most common types of water treatments used are shown

¹⁶ This question was asked when respondents reported not using aquatabs. Three most common reasons for not using aquatabs are shown

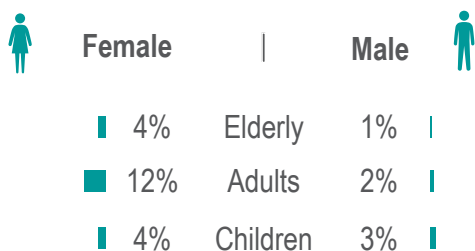

¹⁷ Three most common strategies to compensate for water insufficiency are shown

% of households reporting women and men facing types of problems accessing latrines^{18,19}

% of households reporting different family members feeling unsafe when using latrines

% of households reporting changes in access to latrines compared to before the monsoon season

Environmental sanitation

% of households reporting spaces used for disposing of domestic waste²⁰

% of households reporting employing different methods for disposing of children's faeces^{21,22}

Methods	
✓ Safe methods	53%
Collected, rinsed and disposed in latrine	42%
Collected and disposed in latrine (not rinsed)	11%
x Unsafe methods	15%
Collected, rinsed and disposed in the shelter	2%
Collected and disposed in an open area	9%
Disposed with other garbage	4%
Buried it	0%
Open defecation	0%

Hygiene

Soap and handwashing

% of households reporting possession of soap for handwashing²³

% of households reporting facing different problems with accessing soap²⁴

¹⁸Respondents could select multiple options

¹⁹Top three most common problems with accessing latrines are shown

²⁰Top three most common locations for disposing of domestic waste are shown

²¹Only households with at least one child under 5 were asked where they dispose of children's faeces. Global WASH Cluster standard: collecting and disposing of children's faeces in a latrine (rinsed and non-rinsed) is considered safe. See: <https://bit.ly/2ACcRCf>

²²Only households reporting having at least one child under 5 were asked about disposing of child faeces; data shown relates to the proportion of all surveyed households and therefore does not equal 100

²³Respondents were asked to present soap to enumerators

²⁴Top three most common problems with accessing soap are shown

²⁵Global WASH Cluster standard: the six critical times when people should wash their hands are (1) before eating, (2) before cooking, (3) after defecation, (4) before breastfeeding, (5) before feeding children, and (6) after handling a child's stool/changing a child's nappy/cleaning a child's bottom. See: <https://bit.ly/2ACcRCf>

% of households identifying different times when someone should wash their hands²⁶

After defecation	93%	Before prayer	33%
Before eating	87%	When hands look dirty	24%
After eating	82%	After handling child faeces	19%
Before cooking/meal preparation	49%	Before breastfeeding	18%
Before feeding children	42%	When hands feel dirty, sticky, oily	7%

% of households reporting methods for handwashing

Soap and water	96%
Water only	4%
Water and ash	0%

Bathing

% of households reporting women and men using types of bathing facilities

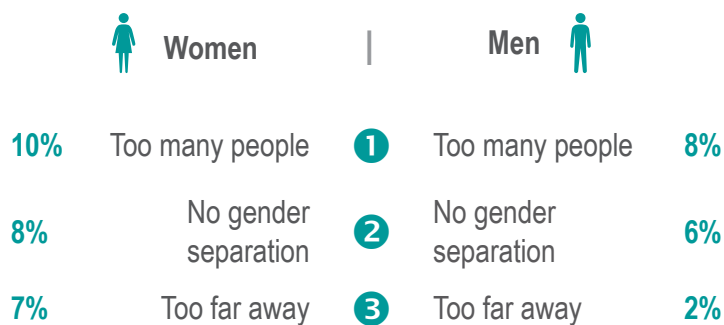

% of households reporting durations to walk to and from bathing facilities normally used

>30 mins	0%
30 mins	0%
20 mins	0%
15 mins	0%
10 mins	27%
≤5 mins	73%

% of households reporting women and men facing problems with accessing bathing facilities

% of households reporting women and men facing types of problems with accessing bathing facilities^{26,27}

% of households reporting different family members feeling unsafe using bathing facilities

% of households reporting changes in access to bathing facilities compared to before the monsoon season

Much better	3%
Better	36%
No change	61%
Worse	0%
Much worse	0%

Laundry

% of households reporting using types of spaces to do laundry

Inside the shelter	53%
Communal bathing facility	44%
Tubewells	3%

²⁶Respondents could select multiple options

²⁷Top three difficulties with accessing bathing facilities for women and men are shown

Hygiene distributions

% of households reporting having received a 'full' WASH hygiene kit²⁸

% of households reporting having received a 'top-up' WASH hygiene kit²⁹

Hygiene training and demonstrations

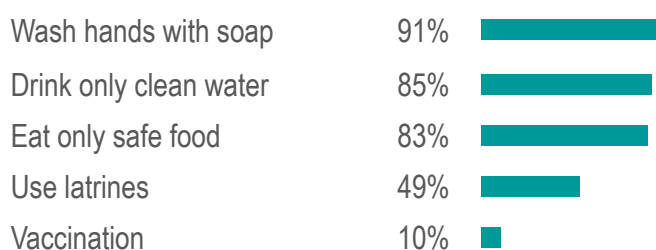

63% of households reported having participated in at least one hygiene training or demonstration within two weeks prior to the survey

% of households reporting different hygiene training or demonstrations that households members^{30,31}

Diarrhoea and cholera/acute water diarrhoea³²

% of households identifying different diarrhoea prevention methods³¹

% of households identifying different diarrhoea causes³¹

% of households identifying different signs of cholera/acute watery diarrhoea³¹

²⁸ Full hygiene kits include non-consumables (i.e. water containers)

²⁹ Top-up hygiene kits include consumables (i.e. soap, shampoo)

³⁰ Top three most common hygiene trainings that households have participated in and would like to participate in are shown

³¹ Respondents could select multiple options

³² Acute water diarrhoea is commonly referred to as AWD

Indicator Table: Follow-up Assessment (August - October 2018)

The following table displays key findings from Camp 24 and identifies the recognised WASH monitoring frameworks from which indicators were adopted in designing the follow-up assessment, highlighting indicators reportable across multiple frameworks where applicable. Please note that the baseline assessment covered Leda camps, which were subsequently partially amalgamated into Camp 24. Given the boundary changes, baseline findings related to the Leda camps have not been included in this table.

Indicators	Monitoring frameworks					Monsoon Follow-up
	Cox's Bazar WASH Sector	Global WASH Cluster	Rohingya Response Joint Response Plan	SDG Joint Monitoring Program	SPHERE Indicators	
<ul style="list-style-type: none"> Water 						
% of households with access to an improved ¹ water source for drinking	✓	✓	✓	✓	✓	100%
% of households with access to an improved ¹ water source for other purposes (i.e. cooking and cleaning)	✓	✓	✓	✓	✓	100%
% of households accessing an adequate/sufficient quantity of water ^{2,3} <ul style="list-style-type: none"> - drinking water = 3 litres/person/day - all domestic water = 15 litres/person/day 	✓				✓	92%
	✓				✓	52%
% of households reporting facing problems with accessing water in the month prior to data collection	✓					13%
% of households that use improved ¹ water sources exceeding 30 minutes collection time ⁴			✓		✓	42%
% of households reporting being satisfied or very satisfied with access to water	✓				✓	83%
% of households that practice household water treatment	✓	✓			✓	46%

Footnotes:

¹Cox's Bazar WASH Sector standard for improved water sources: piped water into settlement, site/public tap/standpipe, tubewell/borehole/handpump, protected dugwell, protected spring, rainwater collection, bottled water, cart with small tank/drum, water tank

²SPHERE standard for sufficient quantity of water: drinking water = 2.5 - 3 litres/person/day, drinking and non-drinking water combined: 15 litres/person/day.

³Water quantity data from the baseline survey is not included in this comparison table due to limitations resulting from the method of estimating water capacity through enumerators' observation of water containers within households. Water quantity data from the follow-up survey is included due to the more reliable method used of enumerators measuring each water container within the household with a tape measure to determine approximate litre capacity of drinking and non-drinking water.

⁴SDG JMP standard for collection time is <30 minutes. Data used to report on this standard from follow-up assessment includes combined travel time to the waterpoint plus waiting/queueing time at the waterpoint.

Please note: Indicators identified as reportable across multiple monitoring frameworks are worded primarily as per Cox's Bazar WASH Sector indicators, with additional monitoring frameworks containing similar indicators identified in the same row with a tick. For example, the Cox's Bazar WASH Sector water indicator is listed in the table, % of households with access to an improved water source. Additional monitoring frameworks have been ticked as they contain indicators that may be reported on by using the same findings from the follow-up survey, as follows: Global WASH Cluster: % of households with access to a source of safe water; SDG Joint Monitoring Program: the proportion of the population that used improved water sources; Rohingya Response JRP: # of targeted people in settlements benefiting from safe water of agreed standards and meeting demand for domestic purposes; SPHERE: % of households where only safe water is used for drinking and cooking. As such, assessment findings may be aggregated to the five listed monitoring frameworks. The same principle applies to all common indicators.
