

Juba County - Water, Sanitation and Hygiene Factsheet

Central Equatoria State, South Sudan

November/December 2018

Overview and Methodology

The dynamic and multi-faceted nature of the South Sudanese displacement crisis has created significant challenges for the delivery of humanitarian aid. Accessibility and security issues within South Sudan have impeded a systematic understanding of WASH needs in many areas of the country, and have created difficulties in establishing a clear and unambiguous system for prioritizing the delivery of aid, thereby limiting the effectiveness of humanitarian planning and limiting the potential impact of donor funding. As this crisis continues to expand, evolve and spill into neighbouring countries, it has become increasingly important to fill information gaps to inform a more effective humanitarian response and planning for immediate life-saving WASH activities and contingency planning for durable solutions.

In 2018, REACH, in close coordination with the WASH Cluster, identified five core WASH indicators: 1. % of Households (HHs) by displacement status; 2. % of HHs reported having safe access to and use an improved water source (borehole, tapstand, water yard) as their main source of drinking water; 3. % of HHs reported having access to a latrine (private, shared, or communal/institutional); 4. % of HHs reported having access to key WASH NFIs (soap, mosquito nets, water containers); and 5. % of HH reported that one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection.

These five indicators were used to establish the first

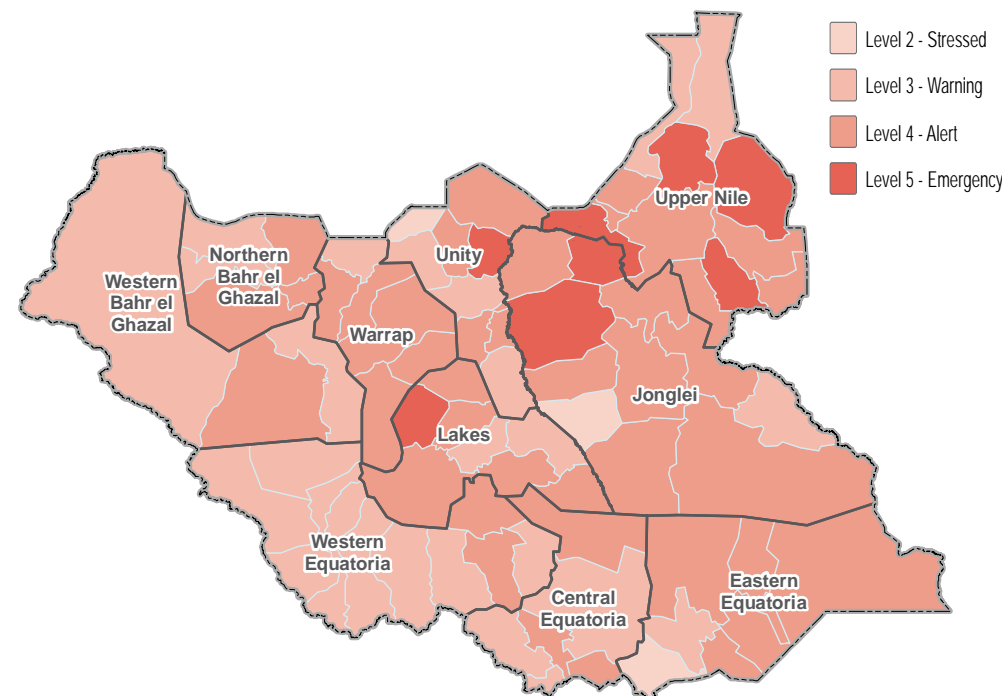

countrywide WASH baseline in July and August of 2018 during Round 22 of the Food Security and Nutrition Monitoring System (FSNMS). FSNMS partners agreed to once again incorporate WASH cluster indicators for FSNMS Round 23 (November and December of 2018). FSNMS is a seasonal countrywide assessment conducted, funded and run by the World Food Programme, UNICEF, and the Food and Agriculture Organization, and supported by REACH in Round 22. FSNMS, established in 2010, is a representative survey that employs two-stage cluster sampling, using a state based sample size and cluster determination. In each county, access permitting, 9 clusters were selected and 12 households interviewed per cluster.

FSNMS is a critical source of information that allows for the identification of affected areas, the prioritization of resources and for monitoring trends. The data collected during FSNMS is used for the Integrated Food Security Phase Classification (IPC) analysis, the Humanitarian Needs Overview (HNO) and the Humanitarian Response Plan (HRP), as well as additional decision making platforms.

FSNMS Assessment Coverage

Full coverage in the county was achieved.

WASH Needs Severity Map

This WASH composite aims to measure the severity of WASH needs in each county. The composite was created with four indicators, each broken into 5 levels of severity, as seen in this matrix <http://bit.ly/2EqRYwJ>. The final severity ranking was created by calculating the average level from the following indicators: -Not having safe access to and use an improved water source (borehole, tapstand, water yard) as a main source of drinking water.

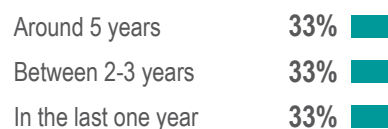

- Not having access to a latrine (private, shared, or communal/institutional).
- Not owning a jerrycan or bucket with a lid and soap, and that every member of the HH did not sleep under a mosquito net.
- Having one or more household members affected by self-reported water or vector borne disease in the two weeks prior to data collection.

Displacement

Percentage of households by displacement status ¹:

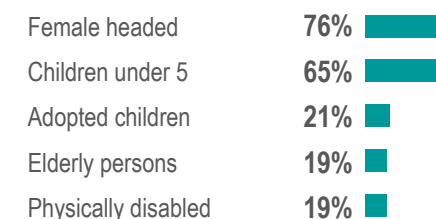

Percentage of IDP households by time arrived in their current location:

Percentage of returnee households by time arrived in their current location:

Most commonly reported vulnerability, by percentage of households: (more than one answer was possible)

Central Equatoria State, South Sudan

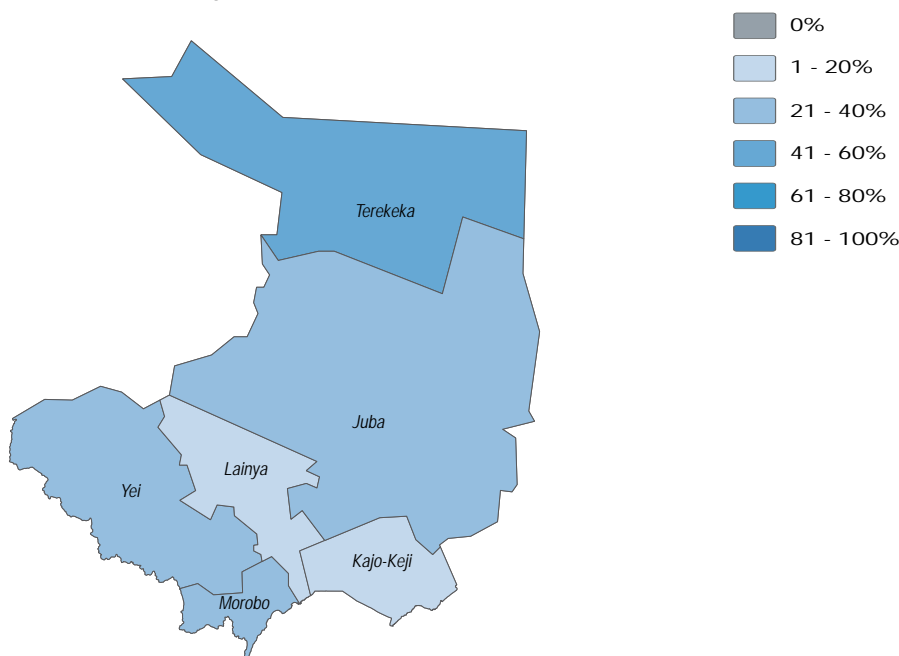

November/December 2018

Water

- 76%** of Juba County HHs reported having safe access to an improved source of drinking water as their main source, in November and December, 2018. This was a decrease from the previous season.
- 79%** of Juba County HHs reported having safe access to an improved source of drinking water as their main source, in July and August, 2018.
- 21%** of HHs reported feeling unsafe while collecting water, in November and December, 2018. This was an increase from the previous season.
- 13%** of HHs reported feeling unsafe while collecting water, in July and August, 2018.

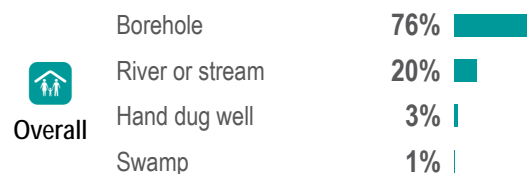

% of HHs having safe access to and use an improved water source (borehole, tapstand, water yard) as their main source of drinking water in under 30 minutes:

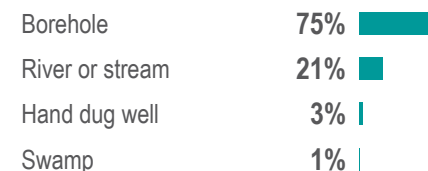

This simple water access composite aims to measure access to an improved water source, without protection concern. The composite was created by averaging the 'yes' responses of households reporting on the following indicators, with all indicators considered to have the same weight:

- Access to a borehole, tapstand, or water yard as the primary source of drinking water
- Can collect water (walking to collection point, waiting, filling container, returning home) in under 30 minutes
- Did not report any security concerns while accessing water point

Most commonly reported sources of drinking water by percentage of households:

Overall

Host

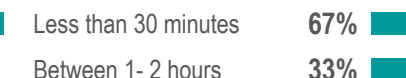

IDPs

Returnees

Most commonly reported time spent collecting drinking water (walking to collection point, waiting, filling container, returning home) by percentage of households:

Juba County - Water, Sanitation and Hygiene Factsheet

Central Equatoria State, South Sudan

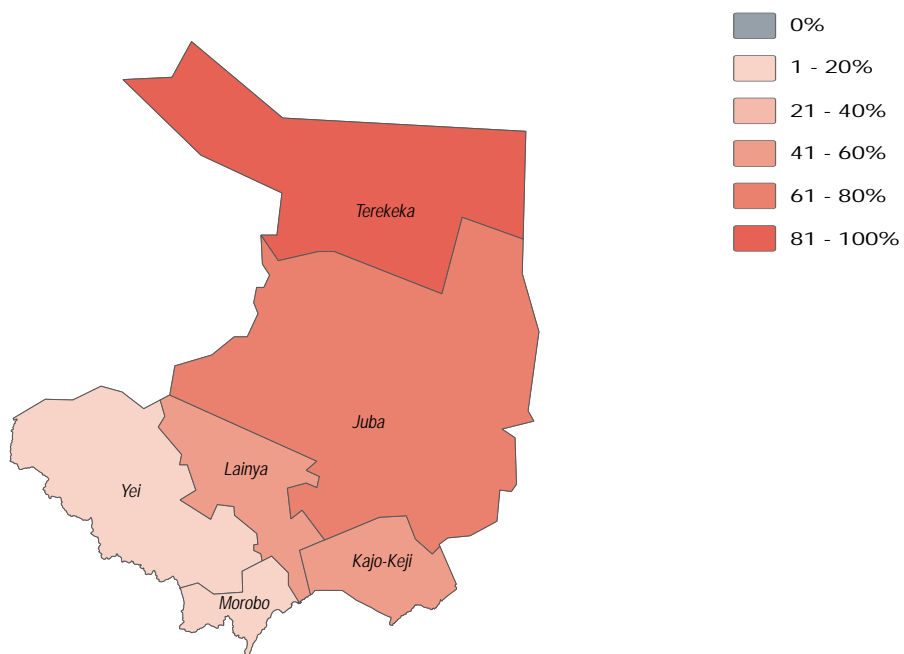

November/December 2018

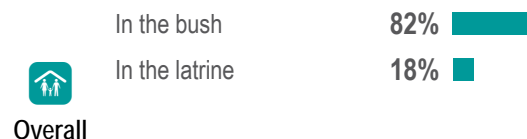

Sanitation

- 22%** of Juba County HHs reported having access to a latrine (private, shared, or communal/institutional), in November and December, 2018. This was an increase from the previous season.
- 19%** of Juba County HHs reported having access to a latrine (private, shared, or communal/institutional), in July and August, 2018.
- 18%** of HHs reported their most common defecation location was a latrine, in November and December, 2018. This was an increase from the previous season.
- 15%** of HHs reported their most common defecation location was a latrine, in July and August, 2018.

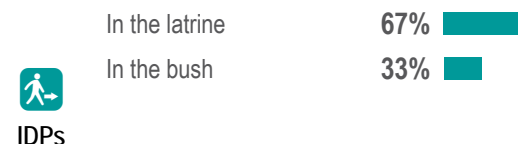

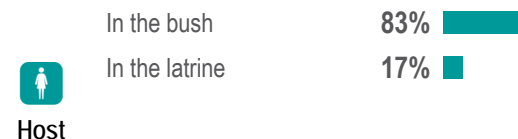

% of HHs not usually using a latrine (private, shared, or communal/institutional)²:

Most commonly reported defecation location by percentage of households:

Most commonly reported excreta disposal methods for children under five by percentage of households:

Juba County - Water, Sanitation and Hygiene Factsheet

Central Equatoria State, South Sudan

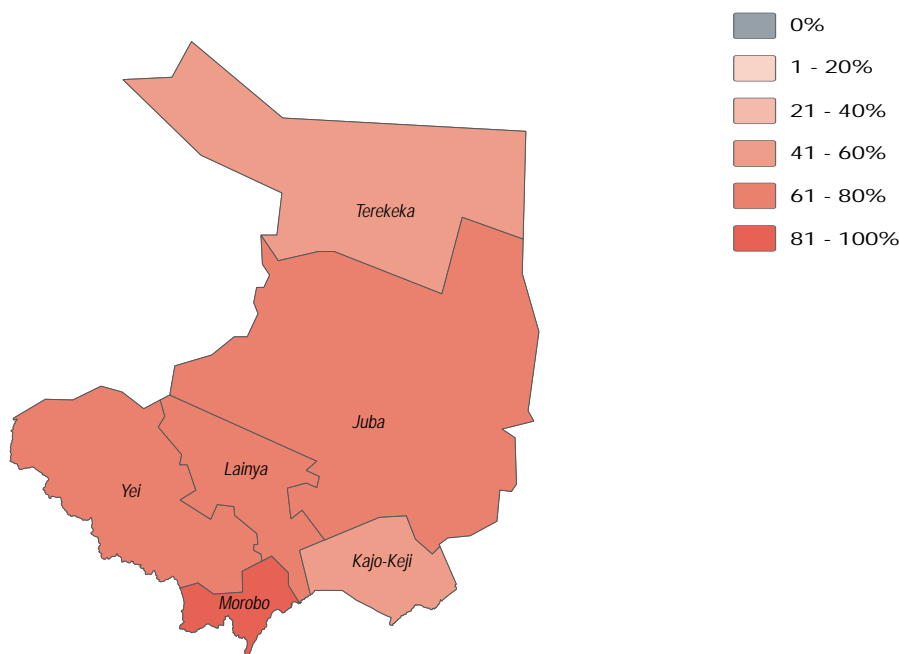

November/December 2018

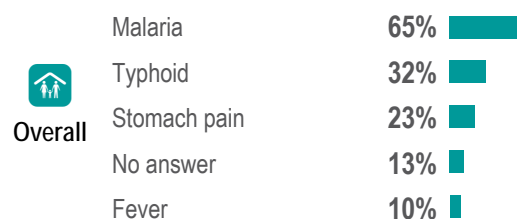

Health

- 61%** of Juba County HHs reported one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection, in November and December, 2018. This was a decrease from the previous season.
- 74%** of Juba County HHs reported one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection, in July and August, 2018.
- Malaria** was the most commonly reported water or vector borne disease in November and December, 2018. This was the same as the previous season.
- Malaria** was the most commonly reported water or vector borne disease in July and August, 2018.

% of HH with one or more HH member affected by self-reported water or vector borne disease in the two weeks prior to data collection:

Most commonly self-reported water or vector borne diseases for adults in the two weeks prior to data collection by percentage of households: (more than one answer was possible)

Overall

Host

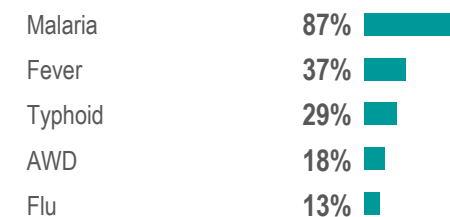

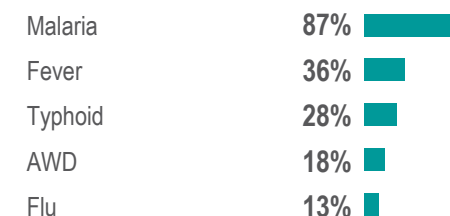

IDPs

Returnees

Most commonly self-reported water or vector borne disease for children under 5 in the two weeks prior to data collection by percentage of households: (more than one answer was possible)

Juba County - Water, Sanitation and Hygiene Factsheet

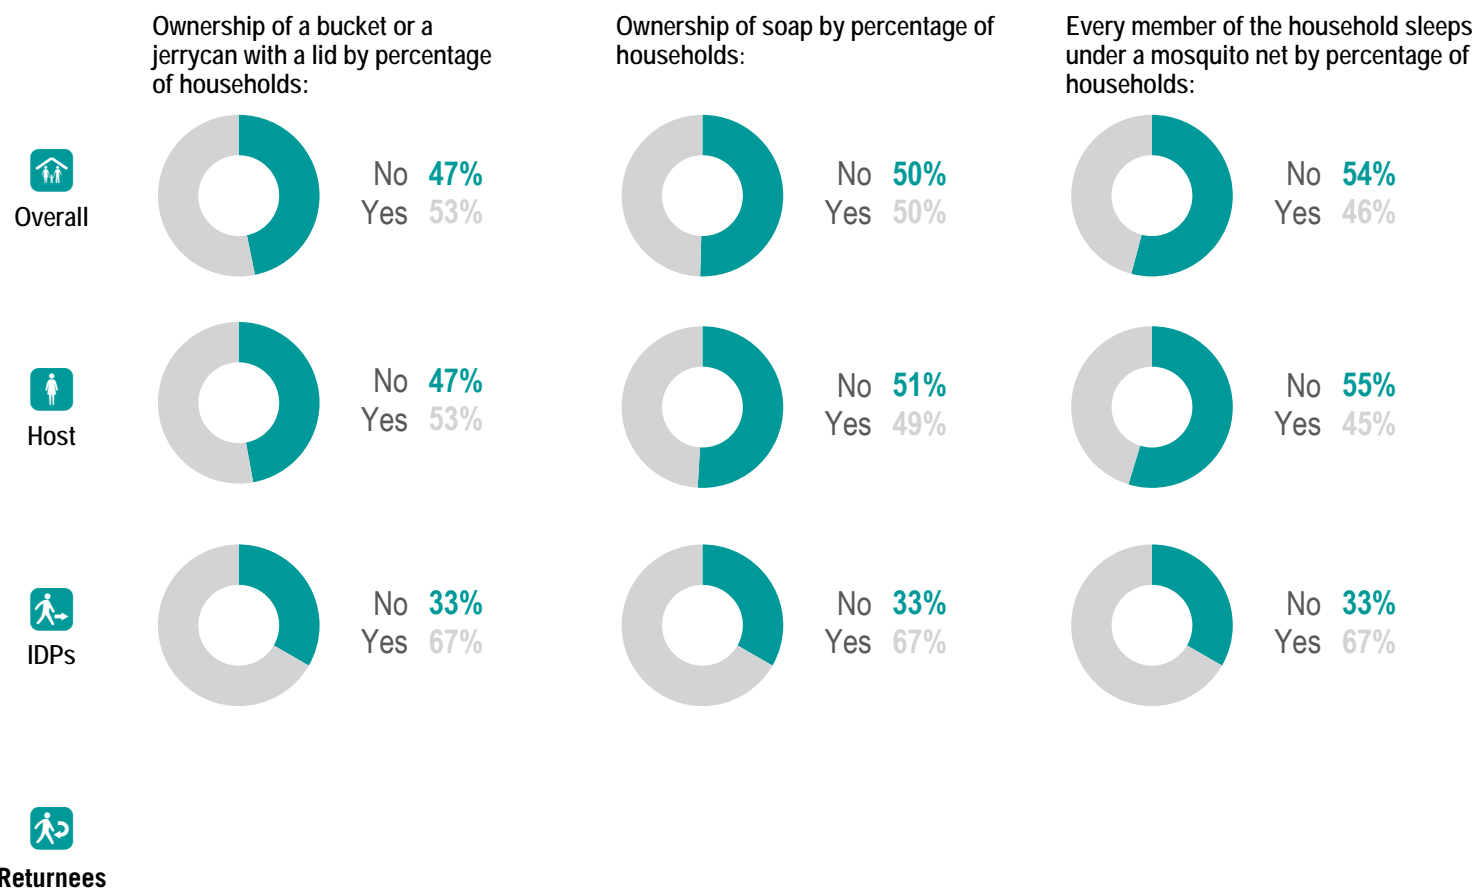

Central Equatoria State, South Sudan

November/December 2018

NFI WASH NFIs

- 17%** of Juba County HHs reported owning at least one jerrycan or bucket with a lid, with access to soap, and that every member of the HH slept under a mosquito net in November and December, 2018. This was a decrease from the previous season.
- 29%** of Juba County HHs reported owning at least one jerrycan or bucket with a lid, with access to soap, and that every member of the HH slept under a mosquito net in HH in July and August, 2018.
- 3** was the average number of jerrycans and/or buckets per HH in July and August, 2018. This was an increase from the previous season.
- 2** was the average number of jerrycans and/or buckets per HH in November and December, 2018.

Endnotes

1. This data is as of November/December 2018. Note, population movement remains fluid.
2. An institutional latrine can be found in a school, hospital, clinic, market place.
3. HHs are asked to produce soap within a minute when assessing the presence of soap in the HH, as if they are not able to locate it within a minute then it stands to reason it is not commonly used.
4. The composite was created by averaging the 'yes' responses of HHs reporting on the following indicators, with all considered to have the same weight: access to soap, access to jerrycans/buckets with lids, everyone in the HH slept under a mosquito net.

About REACH

REACH facilitates the development of information tools and products that enhance the capacity of aid actors to make evidence-based decisions in emergency, recovery and development contexts. All REACH activities are conducted through inter-agency aid coordination mechanisms.

For more information, you can write to our in-country office: southsudan@reach-initiative.org or to our global office: geneva@reach-initiative.org.

Morobo County - Water, Sanitation and Hygiene Factsheet

Central Equatoria State, South Sudan

November/December 2018

Water

50%	of Morobo County HHs reported having safe access to an improved source of drinking water as their main source, in November and December, 2018. This was incomparable to the previous season.
N/A	of Morobo County HHs reported having safe access to an improved source of drinking water as their main source, in July and August, 2018.
3%	of HHs reported feeling unsafe while collecting water, in November and December, 2018. This was incomparable to the previous season.
N/A	of HHs reported feeling unsafe while collecting water, in July and August, 2018.

% of HHs having safe access to and use an improved water source (borehole, tapstand, water yard) as their main source of drinking water in under 30 minutes:

This simple water access composite aims to measure access to an improved water source, without protection concern. The composite was created by averaging the 'yes' responses of households reporting on the following indicators, with all indicators considered to have the same weight:

- Access to a borehole, tapstand, or water yard as the primary source of drinking water
- Can collect water (walking to collection point, waiting, filling container, returning home) in under 30 minutes
- Did not report any security concerns while accessing water point

Most commonly reported sources of drinking water by percentage of households:

 Overall	Borehole	28%	<div></div>
	Hand dug well	22%	<div></div>
	Tap stand	22%	<div></div>
	Unprotected well	18%	<div></div>
	River or stream	8%	<div></div>

Morobo County - Water, Sanitation and Hygiene Factsheet

Central Equatoria State, South Sudan

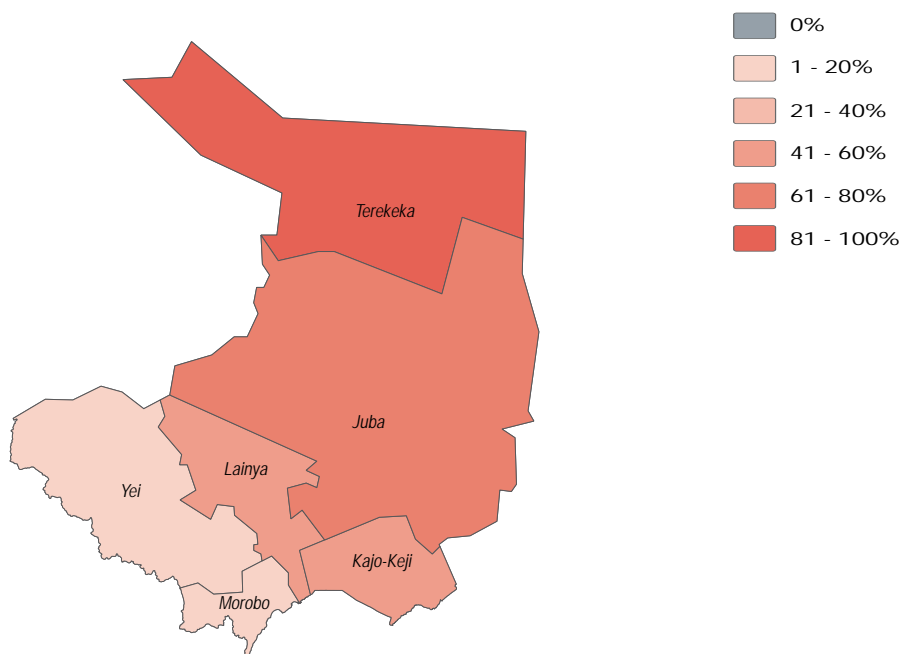

November/December 2018

81%	of Morobo County HHs reported one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection, in November and December, 2018. This was incomparable to the previous season.
N/A	of Morobo County HHs reported one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection, in July and August, 2018.
Malaria	was the most commonly reported water or vector borne disease in November and December, 2018. This was incomparable to the previous season.
N/A	was the most commonly reported water or vector borne disease in July and August, 2018.

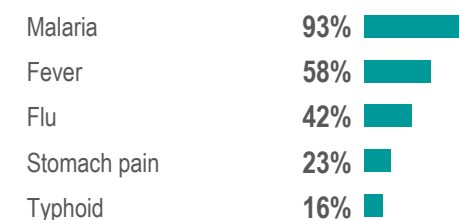

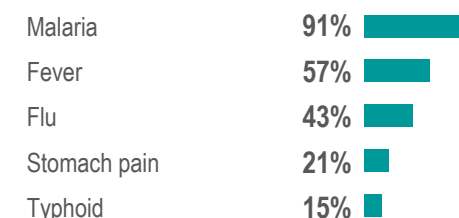

% of HH with one or more HH member affected by self-reported water or vector borne disease in the two weeks prior to data collection:

Most commonly self-reported water or vector borne diseases for adults in the two weeks prior to data collection by percentage of households: (more than one answer was possible)

Most commonly self-reported water or vector borne disease for children under 5 in the two weeks prior to data collection by percentage of households: (more than one answer was possible)

Morobo County - Water, Sanitation and Hygiene Factsheet

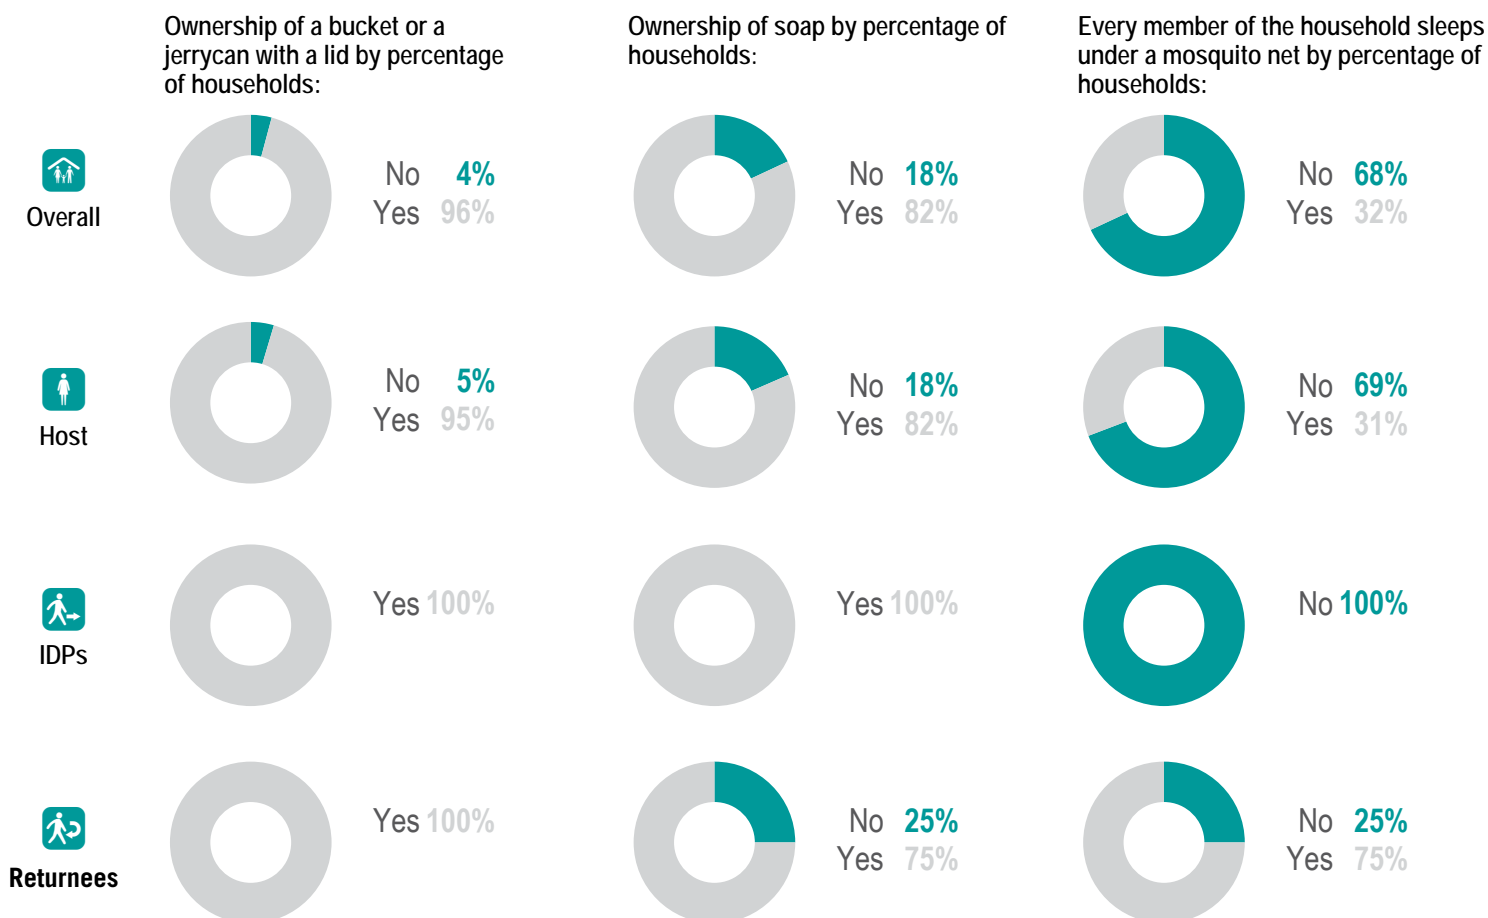

Central Equatoria State, South Sudan

November/December 2018

NFI WASH NFIs

- 6%** of Morobo County HHs reported owning at least one jerrycan or bucket with a lid, with access to soap, and that every member of the HH slept under a mosquito net in November and December, 2018. This was incomparable to the previous season.
- N/A** of Morobo County HHs reported owning at least one jerrycan or bucket with a lid, with access to soap, and that every member of the HH slept under a mosquito net in HH in July and August, 2018.
- 3** was the average number of jerrycans and/or buckets per HH in July and August, 2018. This was incomparable to the previous season.
- N/A** was the average number of jerrycans and/or buckets per HH in November and December, 2018.

Endnotes

1. This data is as of November/December 2018. Note, population movement remains fluid.
2. An institutional latrine can be found in a school, hospital, clinic, market place.
3. HHs are asked to produce soap within a minute when assessing the presence of soap in the HH, as if they are not able to locate it within a minute then it stands to reason it is not commonly used.
4. The composite was created by averaging the 'yes' responses of HHs reporting on the following indicators, with all considered to have the same weight: access to soap, access to jerrycans/buckets with lids, everyone in the HH slept under a mosquito net.

About REACH

REACH facilitates the development of information tools and products that enhance the capacity of aid actors to make evidence-based decisions in emergency, recovery and development contexts. All REACH activities are conducted through inter-agency aid coordination mechanisms.

Terekeka County - Water, Sanitation and Hygiene Factsheet

Central Equatoria State, South Sudan

November/December 2018

Overview and Methodology

The dynamic and multi-faceted nature of the South Sudanese displacement crisis has created significant challenges for the delivery of humanitarian aid. Accessibility and security issues within South Sudan have impeded a systematic understanding of WASH needs in many areas of the country, and have created difficulties in establishing a clear and unambiguous system for prioritizing the delivery of aid, thereby limiting the effectiveness of humanitarian planning and limiting the potential impact of donor funding. As this crisis continues to expand, evolve and spill into neighbouring countries, it has become increasingly important to fill information gaps to inform a more effective humanitarian response and planning for immediate life-saving WASH activities and contingency planning for durable solutions.

In 2018, REACH, in close coordination with the WASH Cluster, identified five core WASH indicators: 1. % of Households (HHs) by displacement status; 2. % of HHs reported having safe access to and use an improved water source (borehole, tapstand, water yard) as their main source of drinking water; 3. % of HHs reported having access to a latrine (private, shared, or communal/institutional); 4. % of HHs reported having access to key WASH NFIs (soap, mosquito nets, water containers); and 5. % of HH reported that one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection.

These five indicators were used to establish the first

Displacement

Percentage of households by displacement status ¹:

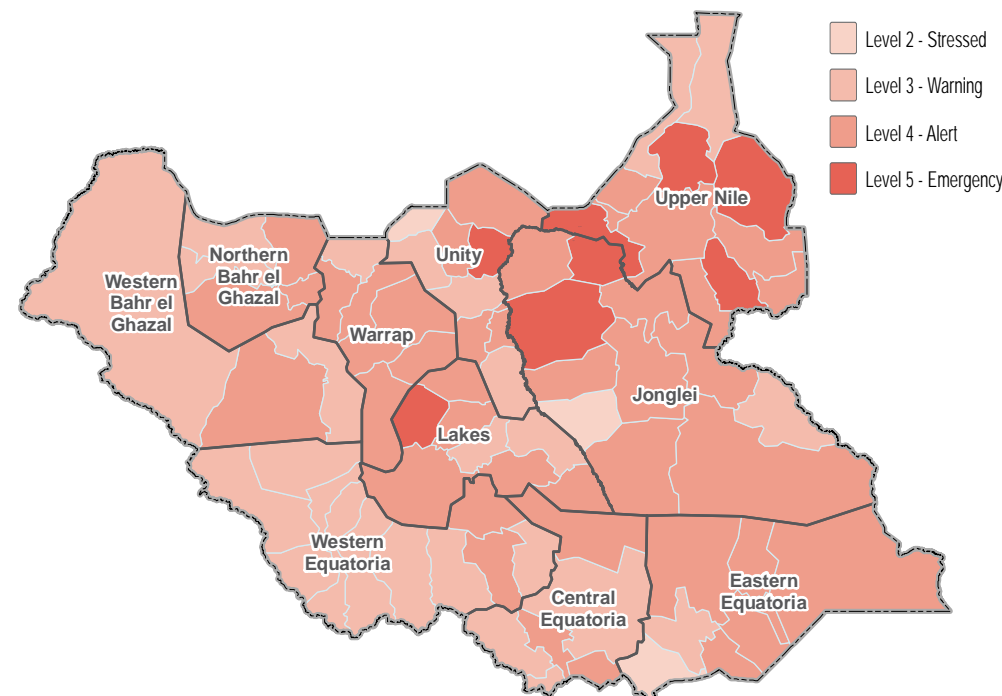

countrywide WASH baseline in July and August of 2018 during Round 22 of the Food Security and Nutrition Monitoring System (FSNMS). FSNMS partners agreed to once again incorporate WASH cluster indicators for FSNMS Round 23 (November and December of 2018). FSNMS is a seasonal countrywide assessment conducted, funded and run by the World Food Programme, UNICEF, and the Food and Agriculture Organization, and supported by REACH in Round 22. FSNMS, established in 2010, is a representative survey that employs two-stage cluster sampling, using a state based sample size and cluster determination. In each county, access permitting, 9 clusters were selected and 12 households interviewed per cluster.

FSNMS is a critical source of information that allows for the identification of affected areas, the prioritization of resources and for monitoring trends. The data collected during FSNMS is used for the Integrated Food Security Phase Classification (IPC) analysis, the Humanitarian Needs Overview (HNO) and the Humanitarian Response Plan (HRP), as well as additional decision making platforms.

FSNMS Assessment Coverage

Full coverage in the county was achieved.

WASH Needs Severity Map

This WASH composite aims to measure the severity of WASH needs in each county. The composite was created with four indicators, each broken into 5 levels of severity, as seen in this matrix <http://bit.ly/2EqRYwJ>. The final severity ranking was created by calculating the average level from the following indicators: -Not having safe access to and use an improved water source (borehole, tapstand, water yard) as a main source of drinking water.

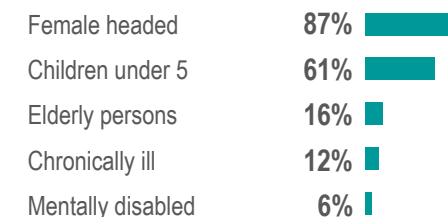

- Not having access to a latrine (private, shared, or communal/institutional).
- Not owning a jerrycan or bucket with a lid and soap, and that every member of the HH did not sleep under a mosquito net.
- Having one or more household members affected by self-reported water or vector borne disease in the two weeks prior to data collection.

Percentage of returnee households by time arrived in their current location:

Percentage of IDP households by time arrived in their current location:

Most commonly reported vulnerability, by percentage of households: (more than one answer was possible)

Ikotos County - Water, Sanitation and Hygiene Factsheet

Eastern Equatoria State, South Sudan

November/December 2018

Overview and Methodology

The dynamic and multi-faceted nature of the South Sudanese displacement crisis has created significant challenges for the delivery of humanitarian aid. Accessibility and security issues within South Sudan have impeded a systematic understanding of WASH needs in many areas of the country, and have created difficulties in establishing a clear and unambiguous system for prioritizing the delivery of aid, thereby limiting the effectiveness of humanitarian planning and limiting the potential impact of donor funding. As this crisis continues to expand, evolve and spill into neighbouring countries, it has become increasingly important to fill information gaps to inform a more effective humanitarian response and planning for immediate life-saving WASH activities and contingency planning for durable solutions.

In 2018, REACH, in close coordination with the WASH Cluster, identified five core WASH indicators: 1. % of Households (HHs) by displacement status; 2. % of HHs reported having safe access to and use an improved water source (borehole, tapstand, water yard) as their main source of drinking water; 3. % of HHs reported having access to a latrine (private, shared, or communal/institutional); 4. % of HHs reported having access to key WASH NFIs (soap, mosquito nets, water containers); and 5. % of HH reported that one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection.

These five indicators were used to establish the first

Displacement

Percentage of households by displacement status ¹:

Host community **100%**

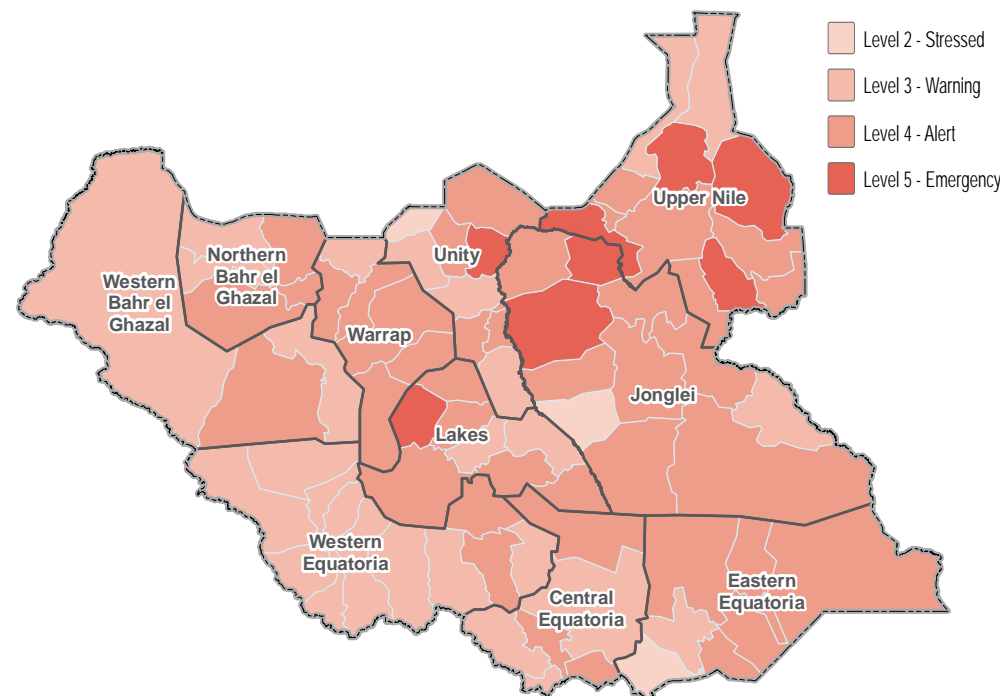

countrywide WASH baseline in July and August of 2018 during Round 22 of the Food Security and Nutrition Monitoring System (FSNMS). FSNMS partners agreed to once again incorporate WASH cluster indicators for FSNMS Round 23 (November and December of 2018). FSNMS is a seasonal countrywide assessment conducted, funded and run by the World Food Programme, UNICEF, and the Food and Agriculture Organization, and supported by REACH in Round 22. FSNMS, established in 2010, is a representative survey that employs two-stage cluster sampling, using a state based sample size and cluster determination. In each county, access permitting, 9 clusters were selected and 12 households interviewed per cluster.

FSNMS is a critical source of information that allows for the identification of affected areas, the prioritization of resources and for monitoring trends. The data collected during FSNMS is used for the Integrated Food Security Phase Classification (IPC) analysis, the Humanitarian Needs Overview (HNO) and the Humanitarian Response Plan (HRP), as well as additional decision making platforms.

FSNMS Assessment Coverage

Full coverage in the county was achieved.

WASH Needs Severity Map

This WASH composite aims to measure the severity of WASH needs in each county. The composite was created with four indicators, each broken into 5 levels of severity, as seen in this matrix <http://bit.ly/2EqRYwJ>. The final severity ranking was created by calculating the average level from the following indicators: -Not having safe access to and use an improved water source (borehole, tapstand, water yard) as a main source of drinking water.

- Not having access to a latrine (private, shared, or communal/institutional).
- Not owning a jerrycan or bucket with a lid and soap, and that every member of the HH did not sleep under a mosquito net.
- Having one or more household members affected by self-reported water or vector borne disease in the two weeks prior to data collection.

Percentage of returnee households by time arrived in their current location:

Most commonly reported vulnerability, by percentage of households: (more than one answer was possible)

Children under 5	78%	
Elderly persons	28%	
Female headed	19%	
Adopted children	6%	
Physically disabled	6%

November/December 2018

Overview and Methodology

The dynamic and multi-faceted nature of the South Sudanese displacement crisis has created significant challenges for the delivery of humanitarian aid. Accessibility and security issues within South Sudan have impeded a systematic understanding of WASH needs in many areas of the country, and have created difficulties in establishing a clear and unambiguous system for prioritizing the delivery of aid, thereby limiting the effectiveness of humanitarian planning and limiting the potential impact of donor funding. As this crisis continues to expand, evolve and spill into neighbouring countries, it has become increasingly important to fill information gaps to inform a more effective humanitarian response and planning for immediate life-saving WASH activities and contingency planning for durable solutions.

In 2018, REACH, in close coordination with the WASH Cluster, identified five core WASH indicators: 1. % of Households (HHs) by displacement status; 2. % of HHs reported having safe access to and use an improved water source (borehole, tapstand, water yard) as their main source of drinking water; 3. % of HHs reported having access to a latrine (private, shared, or communal/institutional); 4. % of HHs reported having access to key WASH NFIs (soap, mosquito nets, water containers); and 5. % of HH reported that one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection.

These five indicators were used to establish the first

Displacement

Percentage of households by displacement status ¹:

Host community **100%**

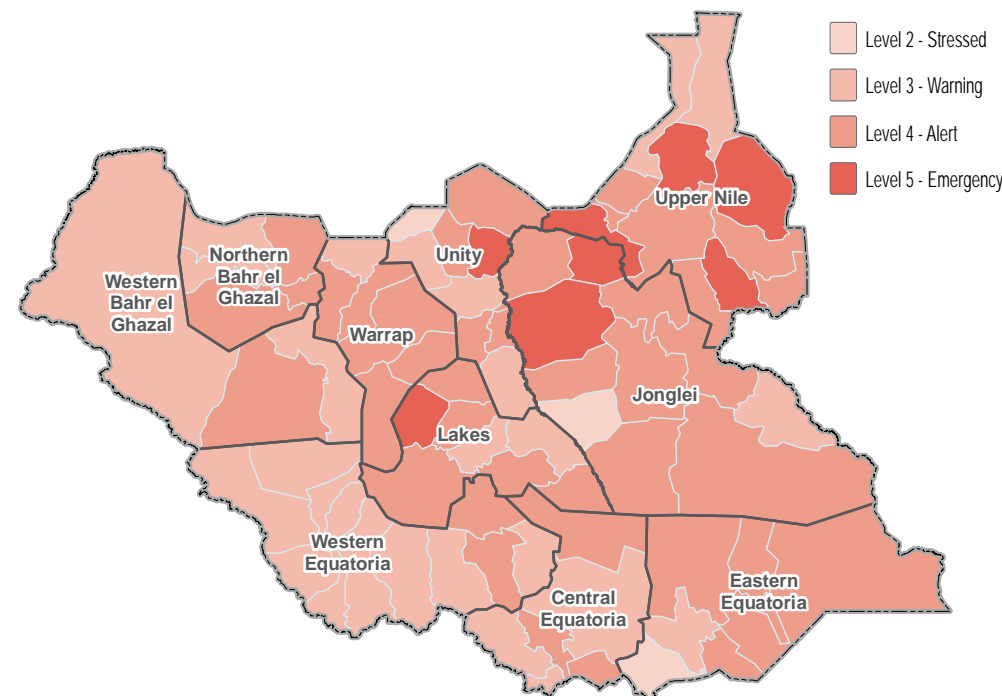

countrywide WASH baseline in July and August of 2018 during Round 22 of the Food Security and Nutrition Monitoring System (FSNMS). FSNMS partners agreed to once again incorporate WASH cluster indicators for FSNMS Round 23 (November and December of 2018). FSNMS is a seasonal countrywide assessment conducted, funded and run by the World Food Programme, UNICEF, and the Food and Agriculture Organization, and supported by REACH in Round 22. FSNMS, established in 2010, is a representative survey that employs two-stage cluster sampling, using a state based sample size and cluster determination. In each county, access permitting, 9 clusters were selected and 12 households interviewed per cluster.

FSNMS is a critical source of information that allows for the identification of affected areas, the prioritization of resources and for monitoring trends. The data collected during FSNMS is used for the Integrated Food Security Phase Classification (IPC) analysis, the Humanitarian Needs Overview (HNO) and the Humanitarian Response Plan (HRP), as well as additional decision making platforms.

FSNMS Assessment Coverage

Full coverage in the county was achieved.

WASH Needs Severity Map

This WASH composite aims to measure the severity of WASH needs in each county. The composite was created with four indicators, each broken into 5 levels of severity, as seen in this matrix <http://bit.ly/2EqRYwJ>. The final severity ranking was created by calculating the average level from the following indicators: -Not having safe access to and use an improved water source (borehole, tapstand, water yard) as a main source of drinking water.

- Not having access to a latrine (private, shared, or communal/institutional).
- Not owning a jerrycan or bucket with a lid and soap, and that every member of the HH did not sleep under a mosquito net.
- Having one or more household members affected by self-reported water or vector borne disease in the two weeks prior to data collection.

Percentage of returnee households by time arrived in their current location:

Most commonly reported vulnerability, by percentage of households: (more than one answer was possible)

Children under 5	81%
Female headed	39%
Adopted children	8%
Elderly persons	6%
Physically disabled	5%

Ezo County - Water, Sanitation and Hygiene Factsheet

Western Equatoria State, South Sudan

November/December 2018

Overview and Methodology

The dynamic and multi-faceted nature of the South Sudanese displacement crisis has created significant challenges for the delivery of humanitarian aid. Accessibility and security issues within South Sudan have impeded a systematic understanding of WASH needs in many areas of the country, and have created difficulties in establishing a clear and unambiguous system for prioritizing the delivery of aid, thereby limiting the effectiveness of humanitarian planning and limiting the potential impact of donor funding. As this crisis continues to expand, evolve and spill into neighbouring countries, it has become increasingly important to fill information gaps to inform a more effective humanitarian response and planning for immediate life-saving WASH activities and contingency planning for durable solutions.

In 2018, REACH, in close coordination with the WASH Cluster, identified five core WASH indicators: 1. % of Households (HHs) by displacement status; 2. % of HHs reported having safe access to and use an improved water source (borehole, tapstand, water yard) as their main source of drinking water; 3. % of HHs reported having access to a latrine (private, shared, or communal/institutional); 4. % of HHs reported having access to key WASH NFIs (soap, mosquito nets, water containers); and 5. % of HH reported that one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection.

These five indicators were used to establish the first

Displacement

Percentage of households by displacement status ¹:

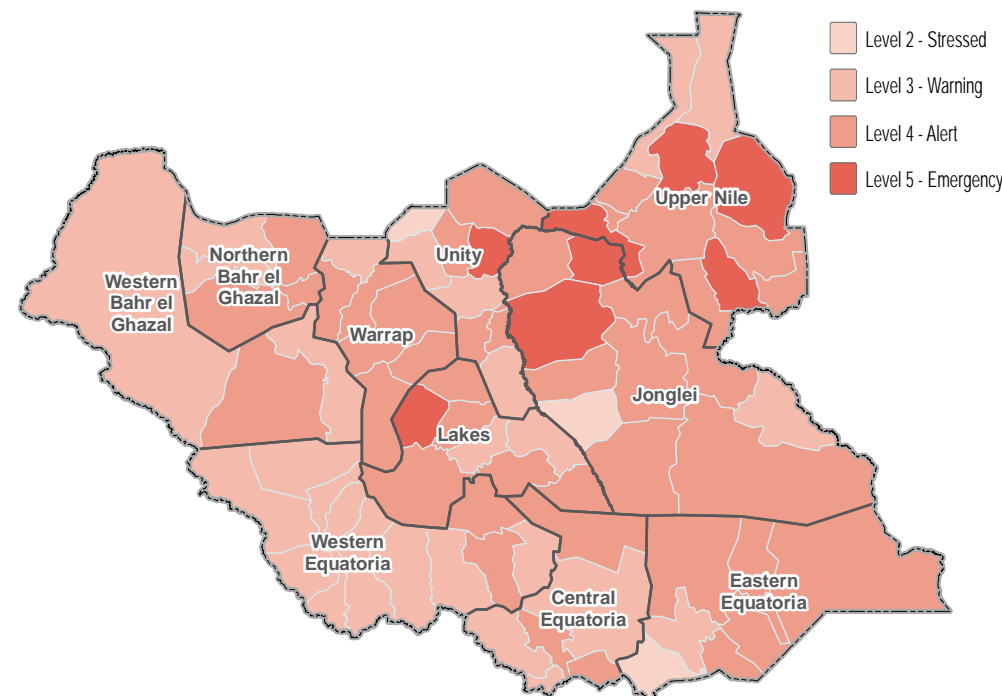

countrywide WASH baseline in July and August of 2018 during Round 22 of the Food Security and Nutrition Monitoring System (FSNMS). FSNMS partners agreed to once again incorporate WASH cluster indicators for FSNMS Round 23 (November and December of 2018). FSNMS is a seasonal countrywide assessment conducted, funded and run by the World Food Programme, UNICEF, and the Food and Agriculture Organization, and supported by REACH in Round 22. FSNMS, established in 2010, is a representative survey that employs two-stage cluster sampling, using a state based sample size and cluster determination. In each county, access permitting, 9 clusters were selected and 12 households interviewed per cluster.

FSNMS is a critical source of information that allows for the identification of affected areas, the prioritization of resources and for monitoring trends. The data collected during FSNMS is used for the Integrated Food Security Phase Classification (IPC) analysis, the Humanitarian Needs Overview (HNO) and the Humanitarian Response Plan (HRP), as well as additional decision making platforms.

FSNMS Assessment Coverage

Full coverage in the county was achieved.

WASH Needs Severity Map

This WASH composite aims to measure the severity of WASH needs in each county. The composite was created with four indicators, each broken into 5 levels of severity, as seen in this matrix <http://bit.ly/2EqRYwJ>. The final severity ranking was created by calculating the average level from the following indicators: -Not having safe access to and use an improved water source (borehole, tapstand, water yard) as a main source of drinking water.

- Not having access to a latrine (private, shared, or communal/institutional).
- Not owning a jerrycan or bucket with a lid and soap, and that every member of the HH did not sleep under a mosquito net.
- Having one or more household members affected by self-reported water or vector borne disease in the two weeks prior to data collection.

Percentage of IDP households by time arrived in their current location:

Percentage of returnee households by time arrived in their current location:

Most commonly reported vulnerability, by percentage of households: (more than one answer was possible)

Western Equatoria State, South Sudan

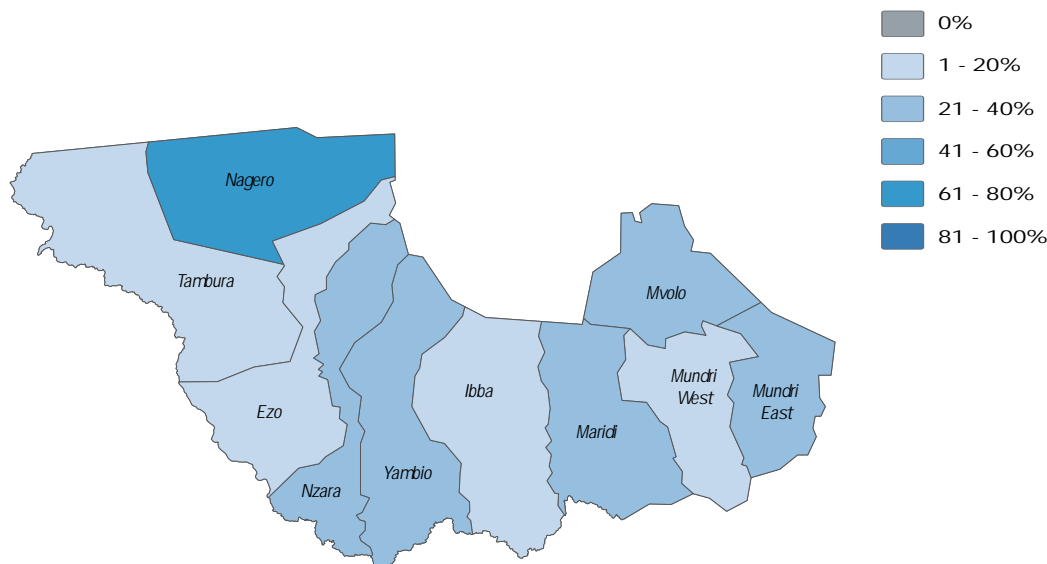

November/December 2018

Overview and Methodology

The dynamic and multi-faceted nature of the South Sudanese displacement crisis has created significant challenges for the delivery of humanitarian aid. Accessibility and security issues within South Sudan have impeded a systematic understanding of WASH needs in many areas of the country, and have created difficulties in establishing a clear and unambiguous system for prioritizing the delivery of aid, thereby limiting the effectiveness of humanitarian planning and limiting the potential impact of donor funding. As this crisis continues to expand, evolve and spill into neighbouring countries, it has become increasingly important to fill information gaps to inform a more effective humanitarian response and planning for immediate life-saving WASH activities and contingency planning for durable solutions.

In 2018, REACH, in close coordination with the WASH Cluster, identified five core WASH indicators: 1. % of Households (HHs) by displacement status; 2. % of HHs reported having safe access to and use an improved water source (borehole, tapstand, water yard) as their main source of drinking water; 3. % of HHs reported having access to a latrine (private, shared, or communal/institutional); 4. % of HHs reported having access to key WASH NFIs (soap, mosquito nets, water containers); and 5. % of HH reported that one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection.

These five indicators were used to establish the first

Displacement

Percentage of households by displacement status ¹:

Host community	98%	<div></div>
IDP	2%	<div></div>

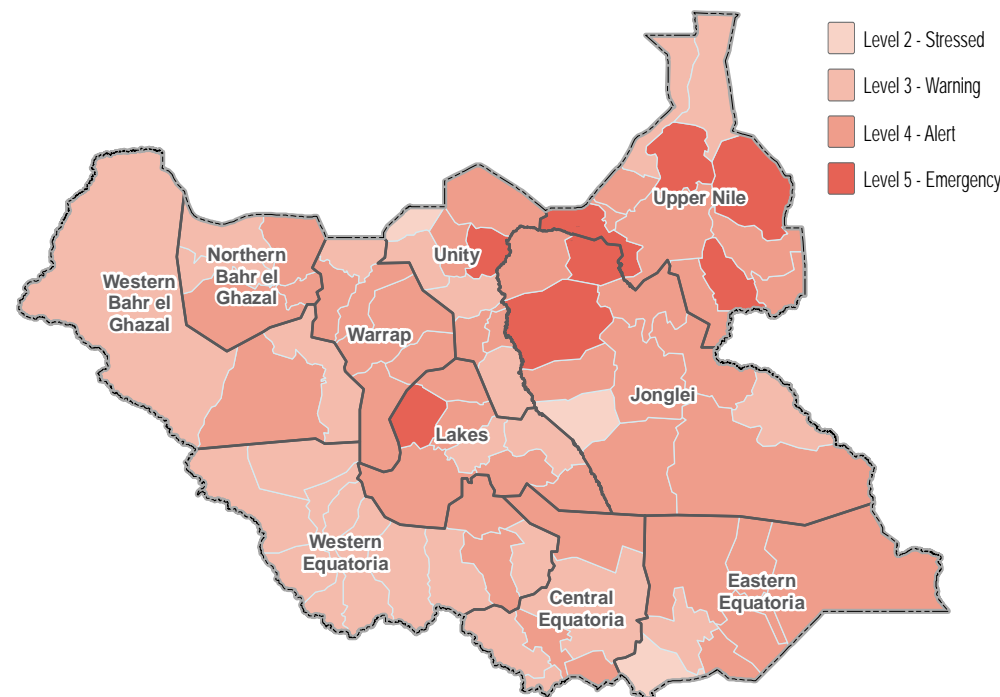

countrywide WASH baseline in July and August of 2018 during Round 22 of the Food Security and Nutrition Monitoring System (FSNMS). FSNMS partners agreed to once again incorporate WASH cluster indicators for FSNMS Round 23 (November and December of 2018). FSNMS is a seasonal countrywide assessment conducted, funded and run by the World Food Programme, UNICEF, and the Food and Agriculture Organization, and supported by REACH in Round 22. FSNMS, established in 2010, is a representative survey that employs two-stage cluster sampling, using a state based sample size and cluster determination. In each county, access permitting, 9 clusters were selected and 12 households interviewed per cluster.

FSNMS is a critical source of information that allows for the identification of affected areas, the prioritization of resources and for monitoring trends. The data collected during FSNMS is used for the Integrated Food Security Phase Classification (IPC) analysis, the Humanitarian Needs Overview (HNO) and the Humanitarian Response Plan (HRP), as well as additional decision making platforms.

FSNMS Assessment Coverage

Full coverage in the county was achieved.

WASH Needs Severity Map

This WASH composite aims to measure the severity of WASH needs in each county. The composite was created with four indicators, each broken into 5 levels of severity, as seen in this matrix <http://bit.ly/2EqRYwJ>. The final severity ranking was created by calculating the average level from the following indicators: -Not having safe access to and use an improved water source (borehole, tapstand, water yard) as a main source of drinking water.

- Not having access to a latrine (private, shared, or communal/institutional).
- Not owning a jerrycan or bucket with a lid and soap, and that every member of the HH did not sleep under a mosquito net.
- Having one or more household members affected by self-reported water or vector borne disease in the two weeks prior to data collection.

Nagero County - Water, Sanitation and Hygiene Factsheet

Western Equatoria State, South Sudan

November/December 2018

Overview and Methodology

The dynamic and multi-faceted nature of the South Sudanese displacement crisis has created significant challenges for the delivery of humanitarian aid. Accessibility and security issues within South Sudan have impeded a systematic understanding of WASH needs in many areas of the country, and have created difficulties in establishing a clear and unambiguous system for prioritizing the delivery of aid, thereby limiting the effectiveness of humanitarian planning and limiting the potential impact of donor funding. As this crisis continues to expand, evolve and spill into neighbouring countries, it has become increasingly important to fill information gaps to inform a more effective humanitarian response and planning for immediate life-saving WASH activities and contingency planning for durable solutions.

In 2018, REACH, in close coordination with the WASH Cluster, identified five core WASH indicators: 1. % of Households (HHs) by displacement status; 2. % of HHs reported having safe access to and use an improved water source (borehole, tapstand, water yard) as their main source of drinking water; 3. % of HHs reported having access to a latrine (private, shared, or communal/institutional); 4. % of HHs reported having access to key WASH NFIs (soap, mosquito nets, water containers); and 5. % of HH reported that one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection.

These five indicators were used to establish the first

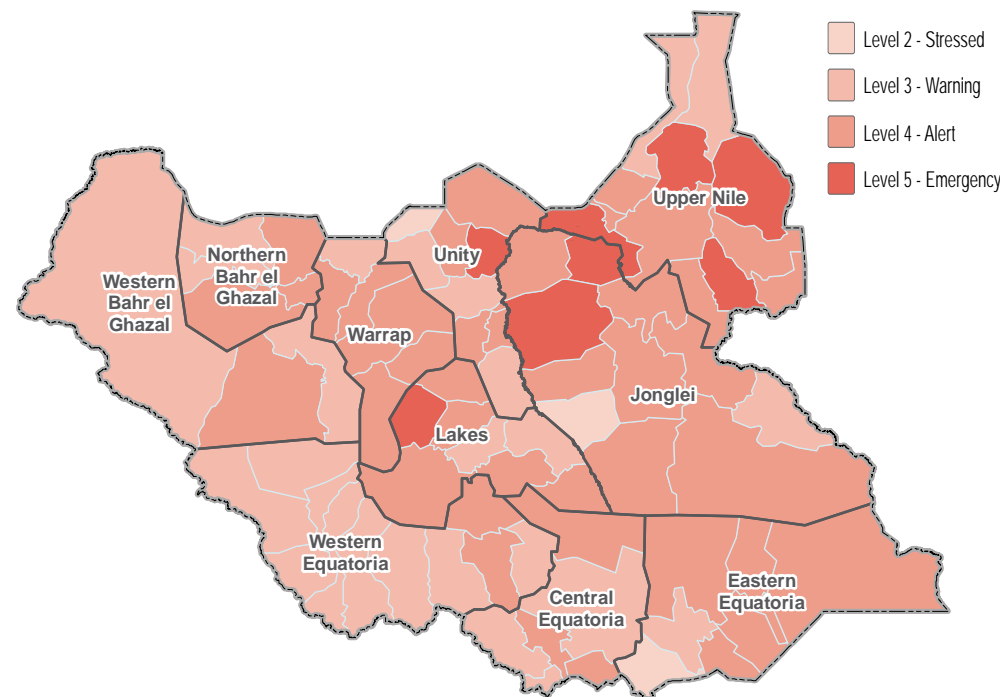

countrywide WASH baseline in July and August of 2018 during Round 22 of the Food Security and Nutrition Monitoring System (FSNMS). FSNMS partners agreed to once again incorporate WASH cluster indicators for FSNMS Round 23 (November and December of 2018). FSNMS is a seasonal countrywide assessment conducted, funded and run by the World Food Programme, UNICEF, and the Food and Agriculture Organization, and supported by REACH in Round 22. FSNMS, established in 2010, is a representative survey that employs two-stage cluster sampling, using a state based sample size and cluster determination. In each county, access permitting, 9 clusters were selected and 12 households interviewed per cluster.

FSNMS is a critical source of information that allows for the identification of affected areas, the prioritization of resources and for monitoring trends. The data collected during FSNMS is used for the Integrated Food Security Phase Classification (IPC) analysis, the Humanitarian Needs Overview (HNO) and the Humanitarian Response Plan (HRP), as well as additional decision making platforms.

FSNMS Assessment Coverage

Partial coverage in the county was achieved.

WASH Needs Severity Map

This WASH composite aims to measure the severity of WASH needs in each county. The composite was created with four indicators, each broken into 5 levels of severity, as seen in this matrix <http://bit.ly/2EgRYwJ>. The final severity ranking was created by calculating the average level from the following indicators: -Not having safe access to and use an improved water source (borehole, tapstand, water yard) as a main source of drinking water.

- Not having access to a latrine (private, shared, or communal/institutional).
- Not owning a jerrycan or bucket with a lid and soap, and that every member of the HH did not sleep under a mosquito net.
- Having one or more household members affected by self-reported water or vector borne disease in the two weeks prior to data collection.

Western Equatoria State, South Sudan

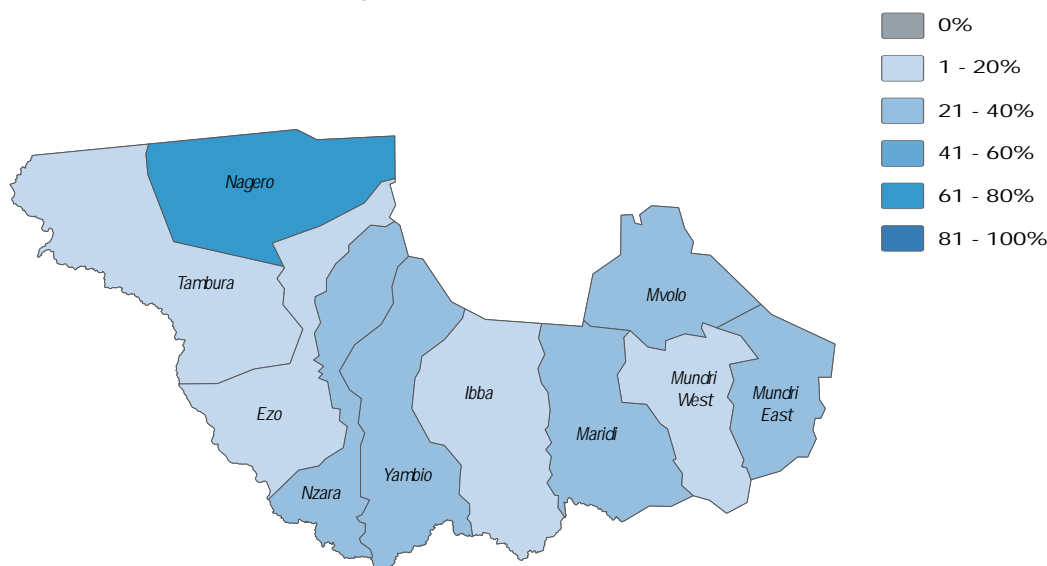

November/December 2018

Sanitation

- 93%** of **Nagero County** HHs reported having access to a latrine (private, shared, or communal/institutional), in November and December, 2018. This was an increase from the previous season.
- 71%** of **Nagero County** HHs reported having access to a latrine (private, shared, or communal/institutional), in July and August, 2018.
- 89%** of HHs reported their most common defecation location was a latrine, in November and December, 2018. This was an increase from the previous season.
- 52%** of HHs reported their most common defecation location was a latrine, in July and August, 2018.

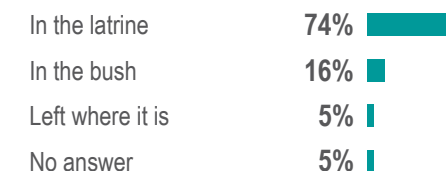

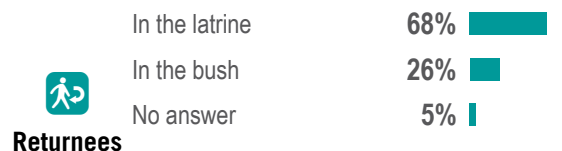

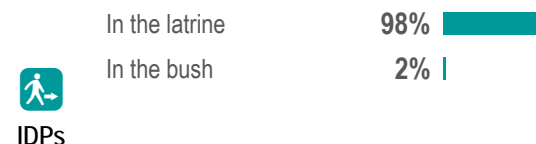

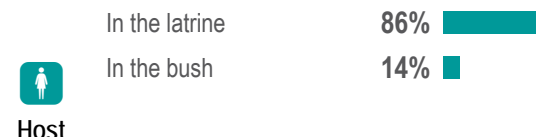

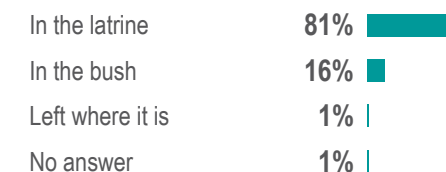

% of HHs not usually using a latrine (private, shared, or communal/institutional)²:

Most commonly reported defecation location by percentage of households:

Most commonly reported excreta disposal methods for children under five by percentage of households:

Nagero County - Water, Sanitation and Hygiene Factsheet

Western Equatoria State, South Sudan

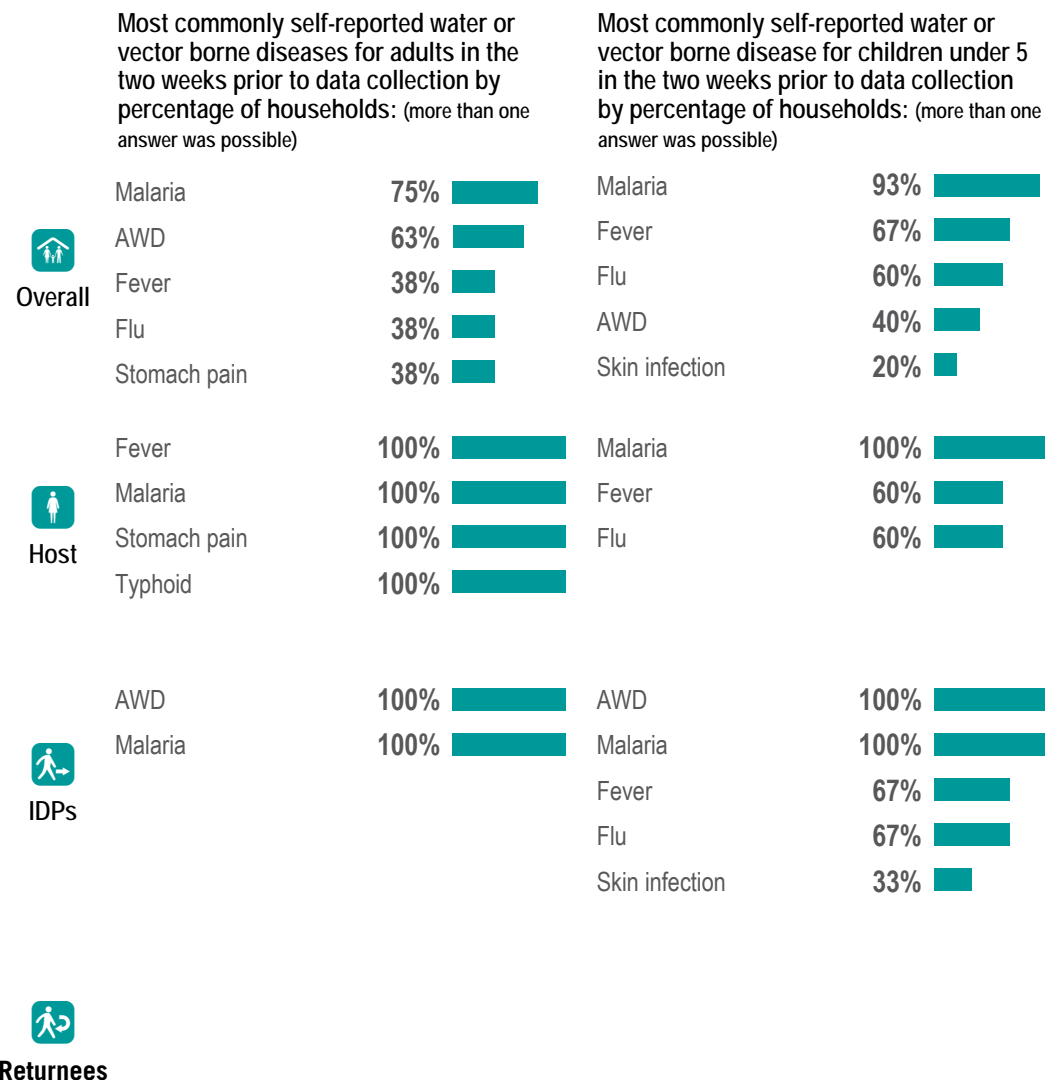

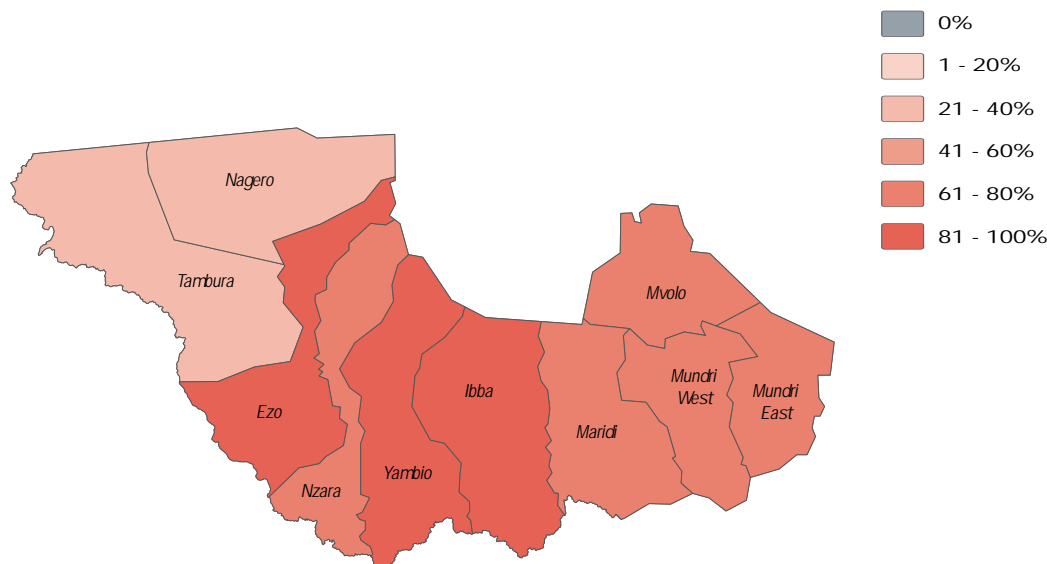

November/December 2018

Health

- 27%** of Nagero County HHs reported one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection, in November and December, 2018. This was a decrease from the previous season.
- 86%** of Nagero County HHs reported one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection, in July and August, 2018.
- Malaria** was the most commonly reported water or vector borne disease in November and December, 2018. This was the same as the previous season.
- Malaria** was the most commonly reported water or vector borne disease in July and August, 2018.

% of HH with one or more HH member affected by self-reported water or vector borne disease in the two weeks prior to data collection:

Nagero County - Water, Sanitation and Hygiene Factsheet

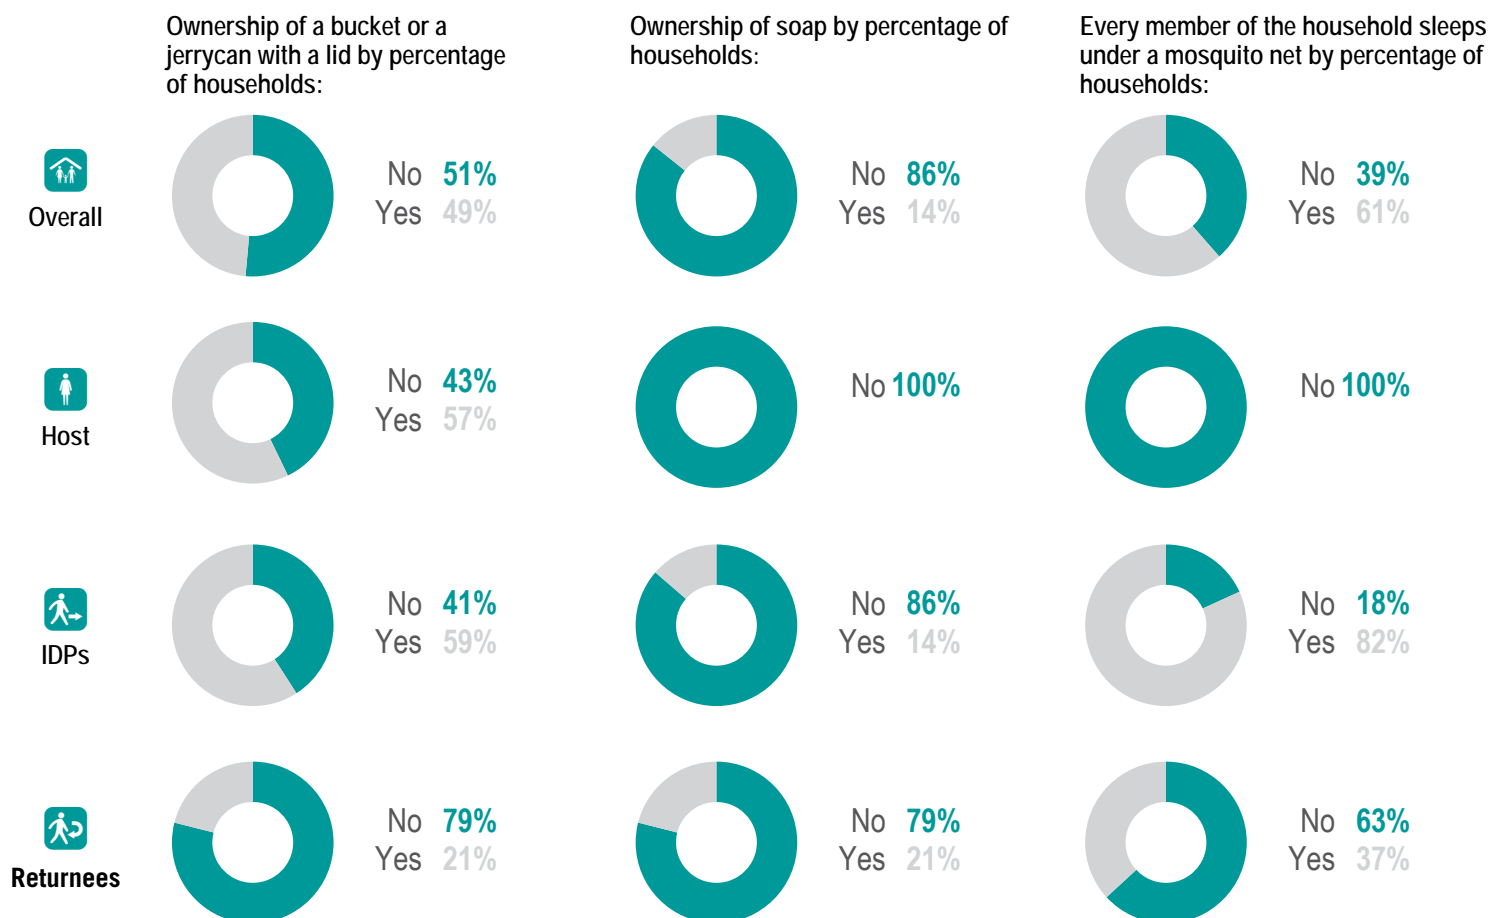

Western Equatoria State, South Sudan

November/December 2018

NFI WASH NFIs

- 4%** of Nagero County HHs reported owning at least one jerrycan or bucket with a lid, with access to soap, and that every member of the HH slept under a mosquito net in November and December, 2018. This was a decrease from the previous season.
- 11%** of Nagero County HHs reported owning at least one jerrycan or bucket with a lid, with access to soap, and that every member of the HH slept under a mosquito net in HH in July and August, 2018.
- 1** was the average number of jerrycans and/or buckets per HH in July and August, 2018. This was a decrease from the previous season.
- 4** was the average number of jerrycans and/or buckets per HH in November and December, 2018.

Endnotes

1. This data is as of November/December 2018. Note, population movement remains fluid.
2. An institutional latrine can be found in a school, hospital, clinic, market place.
3. HHs are asked to produce soap within a minute when assessing the presence of soap in the HH, as if they are not able to locate it within a minute then it stands to reason it is not commonly used.
4. The composite was created by averaging the 'yes' responses of HHs reporting on the following indicators, with all considered to have the same weight: access to soap, access to jerrycans/buckets with lids, everyone in the HH slept under a mosquito net.

About REACH

REACH facilitates the development of information tools and products that enhance the capacity of aid actors to make evidence-based decisions in emergency, recovery and development contexts. All REACH activities are conducted through inter-agency aid coordination mechanisms.

Nzara County - Water, Sanitation and Hygiene Factsheet

Western Equatoria State, South Sudan

November/December 2018

Overview and Methodology

The dynamic and multi-faceted nature of the South Sudanese displacement crisis has created significant challenges for the delivery of humanitarian aid. Accessibility and security issues within South Sudan have impeded a systematic understanding of WASH needs in many areas of the country, and have created difficulties in establishing a clear and unambiguous system for prioritizing the delivery of aid, thereby limiting the effectiveness of humanitarian planning and limiting the potential impact of donor funding. As this crisis continues to expand, evolve and spill into neighbouring countries, it has become increasingly important to fill information gaps to inform a more effective humanitarian response and planning for immediate life-saving WASH activities and contingency planning for durable solutions.

In 2018, REACH, in close coordination with the WASH Cluster, identified five core WASH indicators: 1. % of Households (HHs) by displacement status; 2. % of HHs reported having safe access to and use an improved water source (borehole, tapstand, water yard) as their main source of drinking water; 3. % of HHs reported having access to a latrine (private, shared, or communal/institutional); 4. % of HHs reported having access to key WASH NFIs (soap, mosquito nets, water containers); and 5. % of HH reported that one or more HH member was affected by self-reported water or vector borne disease in the two weeks prior to data collection.

These five indicators were used to establish the first

Displacement

Percentage of households by displacement status ¹:

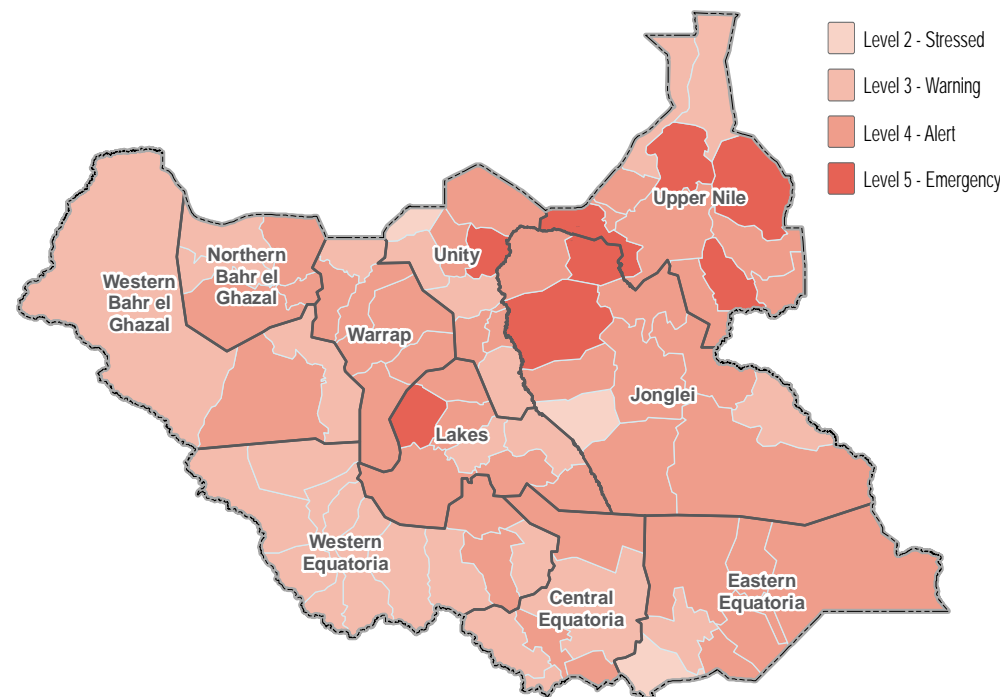

countrywide WASH baseline in July and August of 2018 during Round 22 of the Food Security and Nutrition Monitoring System (FSNMS). FSNMS partners agreed to once again incorporate WASH cluster indicators for FSNMS Round 23 (November and December of 2018). FSNMS is a seasonal countrywide assessment conducted, funded and run by the World Food Programme, UNICEF, and the Food and Agriculture Organization, and supported by REACH in Round 22. FSNMS, established in 2010, is a representative survey that employs two-stage cluster sampling, using a state based sample size and cluster determination. In each county, access permitting, 9 clusters were selected and 12 households interviewed per cluster.

FSNMS is a critical source of information that allows for the identification of affected areas, the prioritization of resources and for monitoring trends. The data collected during FSNMS is used for the Integrated Food Security Phase Classification (IPC) analysis, the Humanitarian Needs Overview (HNO) and the Humanitarian Response Plan (HRP), as well as additional decision making platforms.

FSNMS Assessment Coverage

Partial coverage in the county was achieved.

WASH Needs Severity Map

This WASH composite aims to measure the severity of WASH needs in each county. The composite was created with four indicators, each broken into 5 levels of severity, as seen in this matrix <http://bit.ly/2EqRYwJ>. The final severity ranking was created by calculating the average level from the following indicators: -Not having safe access to and use an improved water source (borehole, tapstand, water yard) as a main source of drinking water.

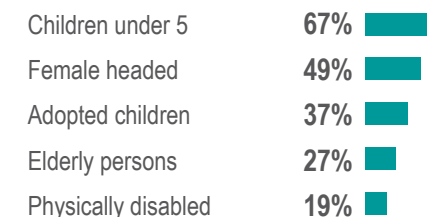

- Not having access to a latrine (private, shared, or communal/institutional).
- Not owning a jerrycan or bucket with a lid and soap, and that every member of the HH did not sleep under a mosquito net.
- Having one or more household members affected by self-reported water or vector borne disease in the two weeks prior to data collection.

Percentage of IDP households by time arrived in their current location:

Percentage of returnee households by time arrived in their current location:

Most commonly reported vulnerability, by percentage of households: (more than one answer was possible)

Yambio County - Water, Sanitation and Hygiene Factsheet

Western Equatoria State, South Sudan

November/December 2018

NFI WASH NFIs

- 40%** of Yambio County HHs reported owning at least one jerrycan or bucket with a lid, with access to soap, and that every member of the HH slept under a mosquito net in November and December, 2018. This was an increase from the previous season.
- 16%** of Yambio County HHs reported owning at least one jerrycan or bucket with a lid, with access to soap, and that every member of the HH slept under a mosquito net in HH in July and August, 2018.
- 3** was the average number of jerrycans and/or buckets per HH in July and August, 2018. This was a decrease from the previous season.
- 4** was the average number of jerrycans and/or buckets per HH in November and December, 2018.

Endnotes

1. This data is as of November/December 2018. Note, population movement remains fluid.
2. An institutional latrine can be found in a school, hospital, clinic, market place.
3. HHs are asked to produce soap within a minute when assessing the presence of soap in the HH, as if they are not able to locate it within a minute then it stands to reason it is not commonly used.
4. The composite was created by averaging the 'yes' responses of HHs reporting on the following indicators, with all considered to have the same weight: access to soap, access to jerrycans/buckets with lids, everyone in the HH slept under a mosquito net.

About REACH

REACH facilitates the development of information tools and products that enhance the capacity of aid actors to make evidence-based decisions in emergency, recovery and development contexts. All REACH activities are conducted through inter-agency aid coordination mechanisms.

For more information, you can write to our in-country office: southsudan@reach-initiative.org or to our global office: geneva@reach-initiative.org.
