Detailed Site Assessment (DSA)

March 2021

Garbahaarey district, Gedo region, Somalia

SOMALIA

CONTEXT

The protracted humanitarian crisis in Somalia is multi-layered and complex. Limited development coupled with recuring climatic shocks, such as drought and riverine-/flash-flooding give rise to high levels of need among affected populations, while insecurity and conflict severely hinder access to humanitarian actors. The majority of internally displaced persons (IDPs) reside in overcrowded shelters in densely populated urban areas, further increasing their exposure to the risks and impact of COVID-19.

The Detailed Site Assessment (DSA) was initiated in coordination with the Camp Coordination and Camp Management (CCCM) Cluster in order to provide the humanitarian community with up-to-date information on the location of IDP sites, the conditions and capacity of the sites, and an estimate of the severity of humanitarian needs of residents. Data collection for the current round of the DSA took place from December 2020 to March 2021 and assessed **2,363 IDP settlements** in 61 districts across Somalia.

METHODOLOGY

Findings are based on key informant (KI) interviews with purposefully sampled KIs who reported on the settlement level. Interviews were conducted by REACH in accessible locations. Targeted areas within districts were determined based on a secondary data review, which drew on previous assessments conducted on IDP populations. After identifying target areas, REACH located IDP settlements by contacting the lowest level of governance¹.

The methodology for the fourth round of the DSA was developed in close consultation with clusters and partner organisations and updated to improve the quality and reliability of data collected regarding IDP settlement locations, estimated size of resident populations, and the severity of humanitarin needs. The severity scale goes from 1 to 4+ and the severity phases are none/minimal, stress, severe, extreme and extreme+. For the list of indicators and the severity score calculations, see page 4 of this factsheet. All findings presented on this factsheet relate to the % of sites with a given response, and should be considered indicative, rather than representative, of the humanitarian situation in assessed sites.

To provide a local, context-specific overview and allow more targeted responses, this factsheet presents a summary of findings of assessed settlements in Garbahaarey district only.

Assessment information

2,177 households*

4 assessed sites hosting

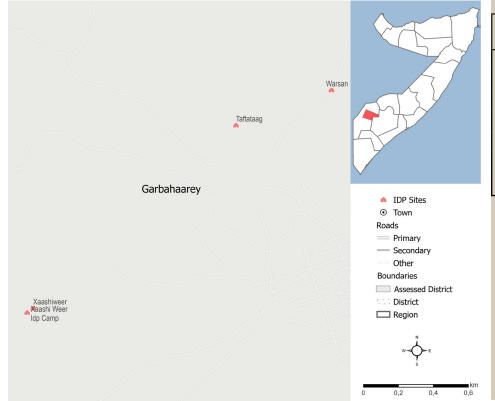

Displacement

Total number of IDP individuals* arriving into a new settlement in the past 3 months	153
Total number of IDP individuals* departing from an old settlement in the past 3 months	28

*This is an estimated number

ASSESSMENT COVERAGE MAP

Summary of severity score*

Clusters	Severity Score	Severity phase
Food Security & Livelihoods	3	Severe
Nutrition	4	Extreme
Health	4	Extreme
Protection	4	Extreme
Shelter & Non-Food Items	2	Stress
Education	3	Severe
Water, Sanitation & Hygiene	4	Extreme

For the list of indicators and the severity score calculations, see page 4 on this factsheet.

*The analysis methodology was adjusted between 2020 and 2021 in order to align with other multi-sectoral assessments carried out by REACH and other partners. This included adapting the ranking system. Therefore, the results for 2021 cannot be compared directly with the previous years, but can be useful to show the differences between the sectors and districts.

SEVERITY SCORE CALCULATION

The severity scores for a given sector is produced by aggregating unmet needs indicators per sector. For this round of the DSA, a simple aggregation methodology has been identified, building on the Multidimensional Poverty Index (MPI) aggregation approach. Using this method, each site is assigned a deprivation score according to its deprivations in the component indicators. The deprivation score of each site is obtained by calculating the percentage of the deprivations experienced, so that the deprivation score for each site lies between 0 and 100. The method relies on the categorization of each indicator on a binary scale: does ("1") / does not ("0") have a gap. The threshold for how a site is considered to have a particular gap or not is determined in advance for each indicator. The DSA IV aggregation methodology outlined below can be described as "MPI-like", using the steps of the MPI approach to determine an aggregated needs severity score, with the addition of "critical indicators" that determine the higher severity scores. The section below outlines guidance on how to produce the aggregation using KI data.

1) Identified indicators that measure needs ('gaps') for each sector, capturing the following key dimensions: accessibility, availability, quality, use, and awareness. Set binary thresholds: does ("1") / does not ("0") have a gap;

2) Identified critical indicators that, on their own, indicate a gap in the sector overall;

3) Identified individual indicator scores (0 or 1) for each site, once data had been collected;

4) Calculated the severity score for each site, based on the following decision tree (tailored to each sector);

a. "Super" critical indicator(s): could lead to a 4+ if an extreme situation is found for the site;

b. **Critical indicators**: using a decision tree approach, a severity class is identified based on a discontinued scale of 1 to 4 (1, 3, 4) depending on the scores of each of the critical indicators;

c. **Non-critical indicators**: the scores of all non-critical indicators are summed up and converted into a percentage of possible total (e.g. 3 out of 4 = 75%) to identify a severity sector;

d. The final score/severity class is obtained by retaining the highest score generated by either the super critical, critical or non-critical indicators. The indicators for each cluster were selected in coordination with all the clusters. In total 53 indicators were selected to assess the severity of needs across 7 clusters.

Note: The indicators for CCCM and Accountability to Affected Population (AAP) are not part of the severity calculations across the sectors. Hence, the CCCM and AAP sections in this factsheet do not present the severity scores.
