COST OF BUSINESS ASSESSMENT: DANA, IDLEB

January 2023 | Northwest Syria

CONTEXT & RATIONALE

Economic activity in Syria has halved since the beginning of the conflict in 2011 as a result of large losses of human capital, destroyed infrastructure, degraded basic services, and disrupted trade.¹ Compounding this, the Syrian economy has suffered from COVID-19, prolonged drought, rapid currency depreciation, high inflation, and the knock-on effects from the crises in Lebanon, Türkiye, and Ukraine. Such factors have contributed to pushing commodity and fuel prices up and greatly eroding the purchasing power of the population, one of the key drivers of humanitarian need.²

Insufficient income and lack of employment opportunities force households in Northwest Syria (NWS) to rely on negative coping strategies such as borrowing money, buying items on credit, sending children to work, and spending savings.³ REACH Labour Market Assessments in NWS revealed that over two-thirds of respondents in both Dana and Idleb cities reported that the lack of job opportunities prevented them from finding employment, while more than half of respondents cited high competition for jobs as a key employment barrier. In addition, 38% of respondents in Dana and 14% of respondents in Idleb reported wanting to start their own business but lacking resources to do so.⁴ In this context, members of the NWS Inter-Cluster Task Force for Business Support Programming (BSP TF) have prioritised implementation of livelihood interventions to help households meet immediate needs and support local businesses to be drivers of local economic activity and employment growth. This has involved, among other activities, the provision of cash grants to businesses, largely focusing on micro and small enterprises.

With the aim of expanding and better targeting such support to include a greater variety of business sizes and sectors, BSP TF partners identified the need for more information on the actual operating costs incurred by Micro, Small, and Medium enterprises (MSMEs) in NWS across different sectors, as well as the key challenges business owners face in maintaining or growing their businesses. As such, REACH, in partnership with the NWS BSP TF, conducted a pilot Cost of Business Assessment (CBA) in Dana urban area to assess the cost of expenditures for MSMEs and inform guidance for financial and other support to MSMEs.

Table 1: Number of assessed businesses in Dana by sector and size**

Sector	Micro	Small	Medium	Total
Agricultural processing/ food production	36	28	15	79
Services	33	37	19	89
Non-food industry/ manufacturing	33	38	15	86
Commercial retail/trade	47	40	22	109
All	149	143	71	350*

KEY MESSAGES

- Findings on overall business costs across the surveyed sizes and sectors indicate that current MSME grant values may not be sufficient to adequately support businesses in getting established or maintaining their operations (see pg. 6).
- Median yearly operating costs and start-up costs appear to vary significantly across sectors and sizes, with agricultural processing/food production representing the sector with highest yearly costs (see pg. 6). This variation necessitates the practice of accounting for business sector when determining MSME grant values and other business support schemes.
- Based on analysis of proportional spending on different expenditure categories, the high business costs documented through the CBA are likely a result of the high cost of inputs, salaries, and inventory, which were the most common categories with the highest proportional costs across sectors and sizes. Business costs for inputs and inventory are highly impacted by the currency fluctuation and depreciation seen in NWS, where the increased cost of inputs and inventory was the most commonly reported challenge to businesses maintaining their current sizes (see pgs. 7-18, 28-29).
- Productive assets accounted for a large portion of most businesses' oneoff expenditures across most assessed sizes and sectors (see pgs. 7-18).
 This broadly supports the idea that expansion of grants that cover larger oneoff costs for the necessary tools, machinery, and other assets which support
 business development and profitability would provide significant financial relief
 to local businesses.
- Beyond financial support, access to new markets and support for marketing were other forms of support more commonly prioritised by businesses.
 As findings also indicate the majority of businesses in Dana do not sell their goods or provide services in other communities of NWS, support in linking Dana businesses to supply chains in other areas could boost revenue and potentially allow for expansion (see pgs. 21, 26-27).
- The large majority (87%) of businesses across sectors reported interest in expansion. While commercial retail/trade businesses were most commonly interested in expansion in terms of increasing their businesses' physical space, businesses in the other three sectors most commonly prioritised acquisition of necessary productive assets. Commercial retail/trade businesses were most common among the handful who reported they would seek to hire new staff for expansion. While very indicative, this may suggest that this sector would be a good targets for employment schemes in Dana (see pgs. 28-29).

METHODOLOGY OVERVIEW

The CBA is a pilot assessment that aimed to quantify the operational costs faced by MSMEs and the barriers they face in trying to maintain or expand their businesses. Through structured individual interviews held between 23 and 31 of January 2023, purposively selected owners of **350 businesses across four key sectors in Dana urban centre** were asked to estimate their businesses' expenditures on items and services across a variety of categories. In addition to information on respective businesses' operational costs, respondents were also asked about challenges to their business operations and any barriers that exist to business expansion.

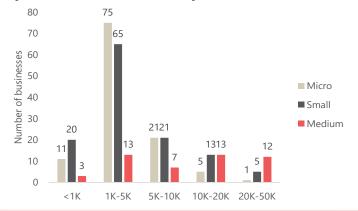

For the purposes of this assessment, and based on the context in NWS, business sizes were defined as follows: **micro: 1-3 employees; small: 4-10 employees; medium: 11-50 employees**. The sectors included in the assessment were: agricultural processing/food production; services; non-food industry/manufacturing; and commercial retail/trade (see definitions, pg. 30). The types of businesses surveyed in the pilot reflects the joint decision of BSP TF members to target more micro and small-sized businesses as those are the business types more commonly targeted by BSP TF members' programming. It was decided in agreement with the BSP TF not to include farming or harvesting businesses given there is regularly updated information collected on the cost of agricultural inputs.⁵

ULIMITATIONS

- 1. The assessment relied on purposive sampling and therefore, the results must be regarded as indicative and not representative. The sample size also does not well-represent home-based businesses as they are harder to identify and include in assessments. As such, home-based businesses in Dana may have different expense and operational profiles than those outlined in this report.
- 2. Determining the type of sector for some businesses was challenging in some cases because of overlap in their activities. To address this issue, partners were consulted to consolidate the best approach for this disaggregation, and enumerators were given clear set of instructions, definitions, and examples to accurately determine the type of sector during data collection with final checks on appropriate classification completed during data processing. Nevertheless, thirteen surveyed businesses were counted under two sectors due to the dual nature of their work.
- 3. The respondents' estimations of recurring and one-off costs for their businesses vary in precision. After each interview, enumerators were asked to record, in their estimation, how precise they perceived the respondents' report of the business expenditures to be. "Precise" meant that respondents were able to refer to business records and get exact figures; "semi-precise" meant that respondents were able to think through expenditures systematically and arrive at informed estimates; and "imprecise" meant that respondents were only able to provide loose estimates, did not keep records, or were unsure about details. For more than half of surveys (58%), enumerators reported that they perceived the respondents' reports to be semi-precise, approximately a third reported the respondents' reports to be precise, and 8% to be imprecise.

- 4. In order to gauge the overhead costs required to start a business, respondents estimated how much it would cost in today's market to purchase the productive assets, equipment, and tools etc. that businesses currently have. In doing so the assessment attempted to provide a rough estimate of the value of such assets today, considering the market rate at which they were purchased would have changed dramatically over time. Respondents were asked to make this calculation themselves on the spot and therefore 'start-up' cost figures are less reliable indications of actual costs incurred.
- 5. Business owners may be more or less inclined to share their actual experiences, fearing that the information shared might be used by competitors, while others might adjust their responses based on the expected effect they anticipate it would have on humanitarian programming. This further underscores the indicativeness of the findings.
- 6. For this assessment, 'business size' was defined by number of employees, which is only one indication of size where others such as yearly revenue may also be an indicator. Overall, analysis suggests that the number of employees was generally a good indication of business size vis-à-vis yearly revenues (see Figure 1). However, there were some variation where businesses with a smaller number of employees reported larger annual revenues or businesses with a higher number of employees that reported lower revenues is seen. This may reflect the fact that different industries are more labour intensive than others and as such have different standard ratios of employees to revenues.

Figure 1: Yearly revenues in Dana in USD by business size

A February Earthquake Disclaimer

The data collection for the CBA took place shortly before the February 2023 earthquakes in Türkiye and Syria and it is possible that business costs may have changed due to the impact on markets and prices as a result. Data from NWS CWG's Joint Market Monitoring Initiative (JMMI) March round shows a 6.6% increase in the cost of the SMEB since January in the Dana community. Further, the USD/TRY exchange rate increased by about 1% from January to March. Compared to monthly SMEB price and exchange rate changes seen across 2022, these increases do not seem irregular, suggesting the impact of the earthquakes on market prices, and thus potentially on business costs, was not significant.

OVERVIEW OF SAMPLED BUSINESSES

Surveyed businesses in Dana were primarily located around the urban centre of Dana community. MSMEs from four key sectors of most interest to BSP TF members were included in the sample: Agricultural Processing and Food Production, services, non-food industry/manufacturing, and commercial retail/trade. These sectors were selected by BSP TF members based on their ability to encompass and provide information on a variety of more specific business types. Within each of these sectors, businesses of various sizes were included, the sample had a greater focus on micro and small businesses as those are the sizes more commonly targeted by BSP TF members.

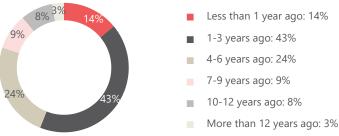

As visualised in Figure 2 below, the majority of sampled businesses (57%) were more newly-established, existing for 3 years or under, meaning they likely face higher risks in business continuity and may require more support to continue operating and build business resilience.

However, a significant amount of surveyed businesses (20%) had been established for a longer time, namely for seven or more years. Additionally and impressively, 9 businesses (3%) reported having been established over 12 years prior, meaning they had been operational before the start of the conflict in 2011 and demonstrating incredible resilience in continuing operations through the many shocks and stresses faced in those years.

Table 1: Number of assessed businesses in Dana by sector and size*

Sector	Micro	Small	Medium	Total
Agricultural processing/ food production	36	28	15	79
Services	33	37	19	89
Non-food industry/ manufacturing	33	38	15	86
Commercial retail/trade	47	40	22	109
All	149	143	71	350*

Figure 2: Date of business establishment (by % of assessed businesses, as of January 2023)

In order to understand the gender dynamics in business ownership and labour force participation, participants were asked about the gender composition of their business' owners and employees. Among surveyed business in Dana, almost a quarter of businesses reported having at least one female employee (23%) and 15% (over 50 businesses) reported having at least one female owner.

This indicates that the assessment had decent representation of women-owned businesses and businesses employing women, and suggests that women's participation in the labour market in Dana may be higher than averages for NWS as a whole.⁷ However, the businesses that reported having at least one female staff were also generally those which were owned by women, underscoring that women-owned businesses tend to hire more women (see further gender analysis on pg. 22).

of the assessed businesses in Dana reported having **at least 1 female owner** (n=53)

of the assessed businesses in Dana reported having at least 1 female employee (n=81)

In terms of operational characteristics, the vast majority of businesses (95%) operated out of a dedicated physical office/store front or a central production/service facility. The remaining 5% of businesses operated through service requests on mobile phones, internet sites, or social media, highlighting that while most businesses still followed the traditional setting of operating out of physical facilities, some businesses taking a home-based approach to conduct their operations and connect with customers online. However, when considering the broader profiles of businesses surveyed for this assessment, home-based businesses are likely under-represented and require further study (see limitations on pg. 3)

5%

of assessed businesses in Dana were **operating without** a **dedicated physical store front** or central production/ service facility

Finally, in terms of businesses' financial operations and use of different currencies, 73% of the interviewed business owners were more comfortable reporting their expenditures in USD in this assessment. This indicates that businesses are more commonly operating in and paying for their expenditures in USD. This may be relevant for partners' considerations of which currency to provide transfers in, especially in relation to knowing if, for example, businesses would generally need to exchange grants given in USD into TRY in order to pay for their expenses.

^{*} Business sizes were defined as follows: micro: 1-3 employees; small: 4-10 employees; medium: 11-50 employees, number of employees includes owners (see definitions on pg. 30).

^{*} Interviews were conducted with a 350 business owners, but there are some businesses that have been counted under two sectors due to the nature of their work. Therefore figures in the table add up to 363.

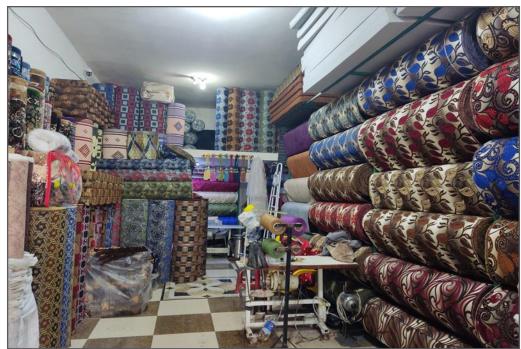

SECTION 1: BUSINESS EXPENSES

INTRODUCTION: BUSINESS EXPENSE PROFILE (BEP)

Respondents were asked about recurring and one-off costs across 13 expenditure categories (see categories and definitions, pg. 30). Recurring costs were calculated as a monthly average over the last three months and one-off costs were taken from the past 12 months. Respondents were also asked whether they were able to estimate the total value of all the productive assets, tools, appliances etc. needed to establish the business and grow it to its current size to estimate business start-up costs (69% of respondents answered that they could).

These respondents were asked to estimate the total value of these assets today in Turkish Lira (TRY) or USD. These figures for the business 'start-up' costs are therefore only rough estimates for initial overhead costs for establishing a business. The results have been assembled into 'business expense profiles' across assessed sectors and business sizes (pgs. 7-18). Total yearly operating costs for each business size in each sector are also summarised and presented in Table 2 (see pg. 6) providing an indication of the cost of running a business in Dana.

Photograph of an assessed business

KEY FINDINGS: BUSINESS EXPENSES

- Total business expenditures for recurring, one-off, total yearly, and start-up costs were higher than expected and varied greatly by sector and size. The lowest median yearly operating cost was 7,590 USD for micro service businesses and the highest was 94,320 USD for medium agricultural processing/food production businesses (see pg. 6).
- As noted above, **businesses in the agricultural processing/food production sector reportedly also had the highest total yearly operating costs in comparison to all other sectors.** This is largely as a result of these businesses having high monthly recurring expenditures on inputs, which comprised, on average, more than 60% of their recurring expenditure, across all business sizes (see pgs. 6, 7-9).
- One-off costs were highest for businesses in the commercial retail/ trade sector due to high expenditure on inventory. Similarly, for almost all businesses, irrespective of the business sector or type, productive assets were consistently reported among top three one-off costs (see pgs. 7-18).
- Among all surveyed micro businesses, median start-up costs were observed to be highest for commercial retail/trade and agricultural processing/food production businesses, at 3,510 and 2,100 USD respectively, and lowest for non-food manufacturing/industry and service businesses, at 1,850 and 1,000 USD (see pg. 6). These figures could support creation of guidance for minimum values of start-up grants in each sector.
- The vast majority of businesses (94%) reported relying on the public network for their businesses' electricity consumption, while only a small proportion of businesses reported private sources. Electricity was generally found to make up the majority of businesses recurring utilities costs (54%) where fluctuations in price and availability can have a significant impact or businesses operations (see pg. 19). As such, ensuring reliable and affordable electricity access for businesses, whether through financial or public service support is a key programmatic objective for livelihoods response partners.

ELECTRICITY SOURCE & EXPENDITURE ZOOM-IN

Electricity sources used by businesses in Dana

As seen in Figure 3, the vast majority of the assessed businesses in Dana reported relying on the public network for their businesses' electricity needs (94%), while only a small proportion of businesses reported relying on private generators as a source of electricity for their activities (7%). Furthermore, very few businesses reported relying on community generators. These trends were similar across all business types as shown in Figure 4.

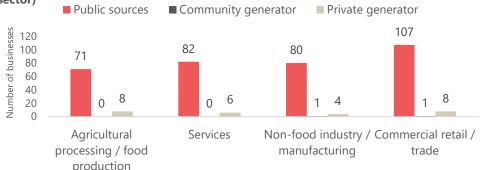

According to REACH Humanitarian Situation Overview of Syria (HSOS) May 2023 round,⁸ on average, electricity is available in Dana community for more than 12 hours per day. However, while electricity is available, the cost of electricity from primary sources such as the network is noted to be a key barrier to access, limiting access to sufficient electricity within the community.⁹ This suggests that overall expenses to sufficiently access electricity, especially in higher usage settings such as that for operating heavy machinery, could be a significant cost burden for businesses.

Figure 3: Reported sources of electricity used (by % of surveyed businesses)*

Further, following the earthquakes in February 2023, findings from REACH and NWS NGO Forum's Rapid Needs Assessment¹⁰ indicate that electricity was accessible to most of Dana's population, despite reports of some damages to the electricity infrastructure. While there were no distinct trends among different sectors in terms of reported sources of electricity, findings suggest that in the absence of accessible and affordable secondary electricity sources, any shocks and unaddressed impacts on the public grid and infrastructure could have significant impact on Dana's business activities.

Figure 4: Reported sources of electricity used (by number of surveyed businesses per sector)*

Electricity expenditure analysis

Electricity expenditures were overall correlated with business sizes, whereby larger businesses tended to report higher electricity costs (see Table 3). Notably, businesses in the non-food industry/manufacturing sector had the highest median expenditure for electricity, in line with expected trends as the sector relies more heavily on machinery and electrical equipment for processing/manufacturing of goods on a comparatively larger scale. While electricity costs make up only a small percent of overall recurring costs (2.3%), electricity makes up the majority of businesses total utilities costs (54%). As such, ensuring that reliable and low cost electricity is available for businesses to conduct their activities is a critical business support need and a key consideration for Early Recovery actors hoping to support economic recovery through improved access to basic services like electricity.

54% of the total median utilities expenditures are from electricity

^{*} Respondents could report on more than one source and therefore findings exceed 100% or exceed the total number of businesses assessed per sector.

^{**} Utilities include sub-categories which are: Electricity (from different sources), water, fuel for heating or cooking telecommunication, and any other utilities.

SECTION 2: BUSINESS OPERATIONS

INTRODUCTION: OPERATIONS, CHALLENGES, AND NEEDS

The following section outlines key operational trends for businesses across assessed sectors in Dana community, identifying some of the challenges they face in maintaining their businesses and the barriers that prevent them from expansion.

While numerous types of businesses are operating in Dana, and some opportunities already exist for those looking to start a new business or expand their current activities, many challenges to running and expanding businesses are still present. Some of these challenges exist as a result of decades of conflict, wider geopolitical issues, absence of stable economic conditions, unavailability of raw materials and inputs, limited import/export activities, irregular supply chain routes, climate-related impacts, and more. However, financial, infrastructural, and staffing obstacles have also affected operations and expansion capacities of businesses across NWS. Understanding the overall challenges, key needs, and top priorities of businesses to mitigate and address such challenges could enable response actors to provide more effective and tailored livelihoods programming.

Photograph of an assessed business

KEY FINDINGS: BUSINESS OPERATIONS

- Businesses overwhelmingly prioritised financial support in the form of business grants when asked about their priority needs (87%). This echoes findings that businesses' primary operational challenges and expansion barriers are related to lack of financial resources and highlights that a scale up of MSME programming would align with the reported needs and priorities of local businesses (see pg. 21).
- While businesses in Dana are largely owned by and largely employ men, it appears that women's participation in the Dana labour market may be higher than female employment trends seen regionally. Service sector businesses had the highest representation of both female owners and staff. Additionally, businesses with female owners tended to employ a higher percentage of female staff, likely due a general concentration of women in sectors that align with cultural norms (see pg. 22).
- Nearly half of businesses reported a decrease in weekly customer numbers in comparison to the same time the previous year (46%), mostly attributed to decreased customer purchasing power and indicating that lack of market demand for other reasons is not a significant factor. Non-food manufacturing and commercial retail/trade businesses most commonly reported decreases, presumably linked to household strategies of reducing non-food/non-essential expenditures to cope with insufficient income (see pg. 25).
- Most businesses source inputs and inventory from wholesalers or retailers within NWS (over 90%), with only a small percentage of primarily commercial retail/trade businesses sourcing from other countries such as Türkiye. Businesses did not often report sourcing directly from manufacturers. Regardless of supply source, businesses did not commonly report supply issues other than those related to high cost of the needed goods, indicating that supply chains were otherwise functional (see pgs. 26-27).
- While Dana is itself a market hub for surrounding communities, only 13% of businesses reported selling/providing outside of Dana community, highlighting that Dana businesses are not significantly linked into value chains in other areas of NWS. Notably, some businesses reporting linkages to A'zaz city markets, potentially linkages which could be strengthened by response partner support to increase access to new markets in line with businesses' reported priority needs (see pgs. 27 and 21).
- Most businesses expressed interest in expansion (87%), with a lack of financial resources as the only barrier reported by a significant percentage. Businesses commonly noted they would seek expansion in terms of physical space or in terms of acquiring new tools, machinery, and other assets. Among businesses that reporting already having a plan for expansion, median estimated expansion costs ranged from 2,000 to 6,000 USD, depending on sector (see pgs. 28-29).

PRIORITY NEEDS & CURRENT BUSINESS SUPPORT

When asked what types of support they were most in need of, businesses overwhelmingly reported the need for access to financial resources, largely in the form of business grants and to a lesser degree in the form of business loans. In light of severe economic decline, rising prices of goods, and lack of access to formal financial services, the desire for financial support is not surprising. This need is further underscored by the fact that the most commonly reported challenges to continued operations and business growth were related to the high price of inputs and inventory and lack of access to financial resources to afford key needs for expansion such as securing a larger operating space, buying needed tools/machinery, or hiring more staff (see pgs. 28-29). The need for financial resources was made more severe increased cost of inputs/inventory in the markets, impacting their normal operations and expenditures.

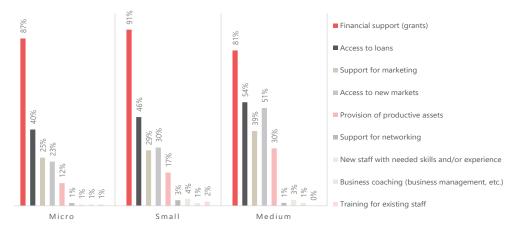

These findings highlight the importance of MSME grant support and underscore the necessity of a scale-up of financial support programs in order to meet the priority needs expresses by local businesses themselves.

Figure 5: Most commonly reported priority needs (by % of surveyed businesses reporting option as a top 3 needs)*

Financial support (grants)	87%	
Access to loans	45%	
Access to new markets	31%	
Support for marketing	29%	
Provision of productive assets	17%	
New staff with needed skills and/or experience	2%	
Support for networking	2%	
Business coaching (business management, etc.)	1%	
Training for existing staff	1%	

Businesses also noted that the need for support to access new markets and for marketing their products, highlighting that businesses perceive themselves being unable to tap into the wider customer base in the area and due to which sales and profit may be lower than possible. This could be a potential opportunity for response partners to support businesses by training and assisting them in marketing operations and provide support in building strategies for becoming integrated into new markets and existing supply chains in other areas of NWS. Some businesses also noted that support for acquiring productive assets would be their top priority, echoing the fact that almost half of businesses who expressed interest in expansion reported they would need additional assets to do so (see pg. 28)

Figure 6: Most commonly reported priority needs by business size (by % of surveyed businesses reporting option as being among their top 3 needs)

A small number of businesses, most commonly micro and small and in the services sector, also prioritised finding new staff with the needed skills/experience or training their existing staff on new skills. This suggests that employment support schemes such as job placement and vocational training would be helpful and best targeted towards these types of businesses. The skills that businesses outlined their current staff most needed were those related to knowledge of marketing, basic computer and IT skills, computer maintenance and management, and IT programming and coding.

In general, businesses across size categories prioritised needs similarly (see Figure 6). However, medium-sized businesses more commonly reported needing access to new markets, which is understandable given that their larger operations require a larger network of customers to maintain their sales for continuity and profitability.

Finally, the vast majority of the assessed businesses reported that they had not received any support in the past year (95%),* indicating that business support is still not readily accessible to most businesses, even as there is a growing recognition among response actors that business support programming is key to improving livelihoods and improving the humanitarian situation. While it is unlikely that response actors could support a majority of businesses in Dana, the results indicate that even a moderate expansion of their reach could support improved livelihood conditions.

Figure 7: Business support assistance reportedly received in 12 months prior to data collection (by % of surveyed businesses)

	-	
No support received	95%	
Cash grants	3%	
In-kind support	1%	
Services or support in accessing service	1%	

BUSINESS STAFFING: EMPLOYEE TYPES AND GENDER, HIRING CHALLENGES 👫

Potentially contradictory to expected trends around staff employment arrangements, CBA data shows that businesses across surveyed sectors (though not including agricultural production) employed mostly full-time staff rather than daily workers or part time employees (see Table 4). This was most notable for businesses in the non-food industry/manufacturing sector (77%) and agricultural processing/food production sector (70%) where it could be assumed daily-wage labourers would traditionally find employment in factory/industrial settings.

This highlights that most businesses are able to employ and retain full-time workers. This stability in staffing was further reflected in the responses of the 97% of business owners in Dana when they reported that they do not face significant challenges in securing the needed staff. However, almost all businesses still additionally relied on some proportion of employees which were either part-time employees or daily workers. Compared to other sectors, businesses in the services sector reported higher proportions of employees who were not full-time i.e. their staff were either part-time employees and/or day labourers (11% both).

Table 4: Staff employment type breakdown (by % of total number of overall staff reported under each employment category per sector)

	Owners	Full-time employees	Part-time employees	Day labourers
Agricultural processing/ food production	20%	70%	5%	6%
Services	17%	61%	11%	11%
Non-food industry/ manufacturing	20%	77%	1%	2%
Commercial retail/trade	25%	59%	12%	3%

Interpretation example: Out of the total number of staff reported by the 79 assessed businesses in the <u>agricultural processing/food production sector.</u> 20% of the total staff were owners, 70% were full-time employees, 5% were part-time employees, and 6% were daily labourers.

Female participation, both as owners and as staff, in businesses in Dana community was observed to be the highest in the services sector. Businesses in this sector mainly include, but are not limited to, beauty salon and parlours, sewing/tailoring/knitting, education, healthcare, hospitality, etc. Comparatively higher participation of women in this sector is in line with global trends where women more commonly participate in service-oriented businesses and lesser labour intensive jobs. Following the same trend, commercial retail/trade was another sector with higher female participation reported across all businesses.

This gender analysis and breakdown of staff and business owners gives a good indication of cultural dimensions and gendered preferences in businesses in Dana, which could be a useful element in programs that aim to strengthen female employment in the labour market, support entrepreneurial initiatives among women and further female business ownership.

Table 5: Staff gender breakdown (by % of total number of staff of all types and total number of owners reported per sector)

	Overall (staff	f of all types)	Business owners		
	Male	Female	Male	Female	
Agricultural processing/ food production	94%	6%	95%	5%	
Services	72%	28%	76%	24%	
Non-food industry/ manufacturing	97%	3%	100%	0%	
Commercial retail/trade	87%	13%	87%	13%	

Interpretation example: Out of the total number of staff of all types reported by the 89 assessed businesses in the <u>service sector</u>, 72% of the total staff were male and 28% were female. Out of the total number of business owners reported by the 89 assessed service businesses, 76% of owners were male and 24% of owners were female.

Figure 8: Businesses that reported facing challenges securing staff in the 12 months prior to data collection (by % of assessed businesses)

Compared to the findings from the December 2021 REACH Dana Labour Market Assessment, ¹¹ which found that most assessed businesses faced hiring challenges, CBA findings point to a reduction of the supply-demand gap in Dana over the past year, with only 3% of businesses reporting challenges (see Figure 8). This is perhaps owed to better staff retention capacities of businesses and/or improved skill sets among the labour force. However, it is likely that the number of people seeking employment has increased as a result of economic pressures and increased unemployment, meaning that businesses have a larger labour pool to hire from. While the number of businesses reporting staffing challenges was limited, small non-food industry/manufacturing businesses was the only category where multiple businessess reported issues, suggesting that employment support efforts might be best targeted here.

CURRENCIES: EXPENDITURES & ACCEPTED PAYMENTS =

Currencies used for business expenditures

Available cash and markets data¹² evidences the fact that, due to inflation and exchange rate fluctuation, populations in NWS largely using currencies other than the Syrian pound (SYP), such as the Turkish lira (TRY) or US dollar (USD), whether for buying or selling goods. Similar findings were observed in Dana, where the majority of assessed businesses preferred reporting their business costs in USD as it is the currency they most commonly use. Among the different sectors, businesses in non-food industry/manufacturing and commercial retail/trade sectors most commonly preferred reporting in USD than any other currency. It is notable that these are the same sectors that reported conducting their businesses internationally such as importing stocks or inputs internationally from outside Syria (see pg. 26).

On the other hand, businesses in the agricultural processing/food production sector preferred using TRY to report their costs, highlighting that TRY is a more common expenditure currency in the sector. This may be related to the fact that 100% of businesses in this sector reported sourcing inputs and inventory from within NWS (see pg. 27) and may be more likely to source from retailers/wholesalers or producers that favour TRY.

Figure 9: Businesses' preferred currency for reporting expenditures by sector (by % of assessed businesses in each sector)

With the exception of non-food industry/manufacturing sector, businesses from all other sectors reported a mixed use of TRY and USD, with some businesses preferring one over the other in comparable proportions. This indicates that, operationally, programming actors need to take into consideration factors such as accessibility to exchange services, availability of currency denominations etc. in a community for businesses to be able to fully utilise the grant provided to them since they might need to exchange the grant value to their preferred currency of business. As such, exchange service providers may be important stakeholders in MSME grant programming and more detailed evaluation of these services in Dana should be undertaken for partners to be able to account for these factors.

Businesses' accepted payment modalities

In terms of payment modalities accepted by surveyed businesses in Dana, the vast majority reported mostly accepting cash in exchange for their products and services, as shown in Figure 10. TRY and USD were the most commonly reported cash currencies that businesses reported accepting. Owing to TRY also being the most commonly used currency by all populations in Idleb governorate, almost all businesses (97%) reported accepting TRY in comparison to 76% who accept USD. While no specific trends were observed between different sectors in terms of accepting payment in cash (TRY) from customers, 100% of businesses in the Agriculture Processing/Food Production sector reported accepting cash in TRY from customers (see Figure 11), in line with the businesses in this sector more often preferring to report their expenditures in TRY (see Figure 9).

Figure 10: Payment modalities accepted from customers (by % of surveyed businesses)*

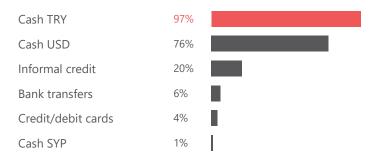

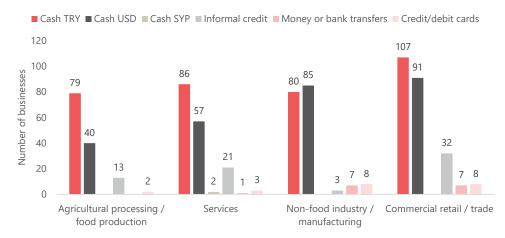

Figure 11: Payment modalities accepted from customers by sector (by number of assessed businesses)*

BUSINESS DONATIONS FOR COMMUNITY SUPPORT SO

Despite the difficulties that businesses face overall in generating profits in spite of high business costs, more than 60% of assessed businesses in Dana reported donating products, services, or profits to community members in need (see Figure 12). This can be interpreted as reflecting socio-cultural practices, religious obligations of Zakat, and personal attitudes of social responsibility of business owners towards their fellow community members.

Compared to other sectors, agricultural processing/food production businesses most commonly reported making donations. This could in part be owing to the type of products these businesses produce (i.e. food items), which may be easier to donate or in higher demand due to high and ever-increasing food prices in NWS markets.¹³ Notably this sector also has the highest yearly operational costs compared to other sectors, which underscores that while expenses and revenues of businesses likely play a role in making donation decisions, cultural and social norms are strong in encouraging businesses to support those in need in their community.

Figure 12: Businesses that reported donating products, services, or profits to support community members in need (by % of surveyed businesses)

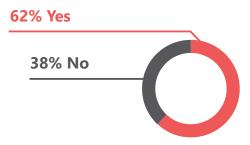

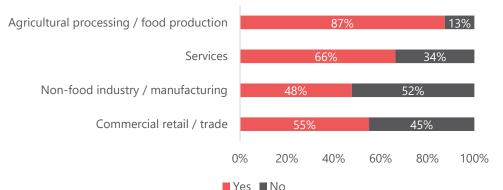

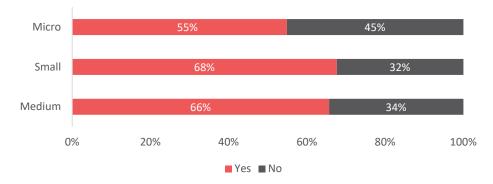

Figure 13: Businesses that reported donating products, services, or profits to support community members in need (by % of surveyed businesses per sector)

Further, businesses of all sizes reported contributing to donations to community members in need. However, in comparison to other business sizes, micro enterprises reported donations in slightly lower proportions, likely owing to their own small-scale production and revenue.

Figure 14: Businesses that reported donating products, services, or profits to support community members in need (by % of surveyed businesses per size)

Overall, support provided to local businesses, whether through externally supported initiatives, partnerships, or MSME grants can not only directly help owners and employees with increased income and job availability but also support broader access to local goods, produce, and services and potentially reduce needs. Availability of such communal support mechanisms are a key resilience capacity for local communities in the face of complex crisis. Overall, support from response actors could be a multiplying factor for local actors to work towards reduce the needs in their communities through charitable action.

BUSINESS DEMAND: CUSTOMER FLUCTUATION

Nearly half of assessed businesses reported a decrease in the number of customers their businesses received per week compared to the same time previous year, with non-food industry/manufacturing and commercial retail/trade businesses most commonly reporting a decrease (see Figures 15 and 16). Across all businesses, such decreases were overwhelmingly attributed to reduced customer incomes (84%) and increase in price of items (79%), both largely linked to continued TRY depreciation. These findings point to the likelihood that households first reduce spending on non-food/non-essential items when faced with insufficient income to meet needs. As such, it is possible that communities in Dana curbed their spending on the products from these sectors, in part explaining the reduction in their customers.

On the other hand, nearly a quarter of businesses reported an increase in the number of weekly customers in comparison to the previous year, most commonly reported by agricultural processing/food production and service sector businesses. More than 40% of these businesses attributed the increase in customers to greater availability of products and services than before, potentially indicating that for some businesses supply chains or productivity had improved since the previous year.

However, as shown in Figure 19, the majority of these businesses reported that the increase in customers was minimal (68%). Nonetheless, the 21%-40% or higher increase noted by the remaining businesses is a positive sign and suggests that room for business growth may be present.

Figure 15: Change in number of customers received per week compared to the same time the previous year (by % of surveyed businesses)

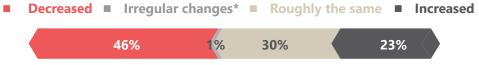

Figure 16: Change in number of customers received per week compared to the same time the previous year by sector (by number of surveyed businesses)

Prices have fallen	37%	
Customers' incomes have risen	11%	

^{*} Businesses reported that the number of customers per week compared to the same time the previous year was unpredictable between increases, decreases, and steady levels.

Respondents could select more than one option and therefore findings exceed 100%.

SUPPLY CHAIN: SUPPLY ROUTES, CHALLENGES, AND AREAS OF SALE ←

Supply routes for inputs and inventory

When business owners were asked where they purchased their inventory and inputs from, the large majority reported purchasing inventory (93%) and inputs (95%) from wholesalers or retailers within NWS (see figure 21). To a lesser extent, surveyed businesses reported securing these goods from wholesalers or retailers located in Türkiye, reported by 9% of businesses for inventory and 5% for inputs.

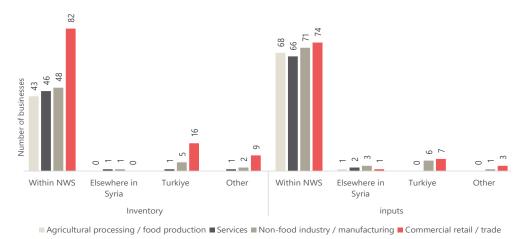

Looking at trends across sectors (see figure 22), surveyed businesses in the commercial retail/trade and non-food industry/manufacturing sectors reported sourcing goods from Türkiye more than businesses in other assessed sectors. These businesses' operations are more vulnerable to impacts of any disruption of cross-border trade and issues with import and transportation. A small number of businesses also reported sourcing inventory or inputs from countries other than Syria or Türkiye, most commonly from China and from India to a lesser extent.

In general, very few businesses purchase directly from manufacturers, meaning that the results of the assessment do not shed light on the origin of such goods and that further research with wholesalers would be required to understand business supply chain routes in NWS. However, the reliance on suppliers from within NWS underlines the importance of the region's market systems in supplying businesses with key items for their operations, regardless of the items' origins.

Figure 21: Supply chain routes for purchase of inputs and inventory (by % of assessed businesses that have reported expenditures for purchasing inputs n=281 or inventory n=227)*

Figure 22: Supply chain routes for purchase of inputs and inventory by sector (by number of businesses per sector and supply route)*

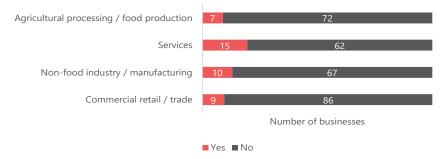

Supply challenges: securing goods within NWS

The majority of businesses that reported securing inputs or inventory from a source within NWS reported that they did not face challenges in doing so. These responses were relatively consistent across all assessed sectors. However, surveyed businesses in the services sector reported facing slightly more challenges compared to other sectors. This is potentially linked to the types of enterprises from the services sector that participated in the assessment (hair/beauty salons, mechanics, tailors) and the financial and physical accessibility of the inputs and inventory they require.

Among the few businesses that did report facing challenges, most were related to pressures that impact the affordability of goods, rather than those relating to issues with supply chain functionality and availability.

Figure 23: Number of businesses reporting challenges securing goods within NWS by sector (by number of 316 businesses reporting securing goods within NWS*)

^{*} Respondents could select more than one option and therefore findings exceed 100%.

Supply challenges: securing goods from Türkiye

On the other hand, nearly half of the businesses that reported securing goods from Türkiye reported that they faced challenges in doing so (45%). Reflective of issues generally faced in international or cross border trade, these businesses reported that the challenges were mostly related to high taxation and custom fees on foreign goods and transportation issues, particularly high cost of transportation and delays in delivery of goods.

Figure 24: Businesses that reported challenges securing goods from Türkiye (by % of the 31 surveyed businesses reporting sourcing inputs or inventory from Türkiye)

Primary areas of sale for businesses' goods and products/service provision

In order to understand how Dana businesses themselves fit into larger supply chains and may support availability of goods and services in other markets, businesses were asked about the locations in which they sell their products or provide their services. As shown in Figure 25, assessed businesses did not commonly report selling goods or providing services outside of Dana community (only 15% reported doing so), and only a handful (2%) reported that Dana community was not their primary area of sale or provision.

Figure 25: Businesses that reported selling their goods/providing their services outside of Dana community (by % of assessed businesses)

2%

of all assessed businesses reported locations outside of Dana community as their *primary* area of sale/service provision.

Of those businesses that reported operating outside of Dana, there was no clear trend in terms of sectors or sizes that more commonly did so. Findings highlight that while Dana market itself is a market hub where people from surrounding areas come to buy goods, ¹⁴ and acknowledging that they may be indirectly linked by wholesalers/larger retailers who buy and resell their goods, Dana businesses do not appear to be deeply linked to market supply in other locations. However, businesses seem to recognise this and noted that they would like to receive support to expand into and access new markets (see pg. 21), indicating that the lack of linkages to other markets, rather than lack of potential, may be an issue.

Notably, the majority of businesses that reported selling their products or provide their services outside of the Dana community are medium-sized (52%), which could be expected given that larger operations may have more the capacity for wider market engagement and also require it for profitability. Where businesses did sell/provide outside of Dana community, the majority still did so in other communities within Dana sub-district, most commonly in Sarmada market. However a small number of businesses indicated sale/provision to A'zaz city, potentially pointing to an opportunity for increased supply chain linkages between the two urban centres.

Figure 26: Most common sub-districts of locations outside of Dana community where businesses reportedly sell their goods/provide services (by % and number of 53 assessed businesses also selling goods/providing services in other locations)

A'zaz (A'zaz, Aleppo)	22%	
Deir Hassan (Dana, Idleb)	18%	

BUSINESS CONTINUITY AND EXPANSION

Business continuity challenges

To understand how businesses perceived what conditions for conducting their activities in Dana in the future would be like, business owners were asked what challenge they anticipated in maintaining their businesses at the current size or profitability in the coming six months. While nearly quarter of businesses reported that they did not anticipate any challenges, a majority of businesses anticipated challenges related to increase in costs associated with running businesses, and diminished consumer purchasing power (see figure 28).

While businesses did not generally report that they were currently facing major challenges in procuring inputs and inventory, irrespective of the supply chain routes (see pgs. 27-28), future shocks such as further TRY depreciation and corresponding price inflation would likely negatively affect overall costs of required inputs and inventory, both already cited as major expenditure categories by businesses (see pgs. 7-18). Echoing this, businesses noted that increased costs of inventory and inputs and of other operational expenditures could pose as challenges to maintaining their business (54% and 15% respectively).

Figure 28: Anticipated challenges to maintaining business at current size and/or profitability in the 6 months following data collection (by % of assessed businesses)*

Increased cost of inventory/inputs	54%	
Decreased customer incomes	51%	
No challenges anticipated	24%	
Increased cost for other operational expenditures	15%	
Reduced demand for what the business provides	15%	

NWS CWG JMMI data from July to December 2022¹⁵ shows consistent increase in the price of essential items in NWS markets. Adding to this, due to lack of sufficient employment opportunities, high competition for available jobs, and the generally low salaries available, household income and purchasing powers has decreased and consumers have less disposable income. This has direct implications on businesses since in the absence of sufficient sales and demand for their products and services, their overall revenues and profitability could be severely impacted.

This likely scenario is reflected in CBA findings by the 51% of businesses that reported that a decrease in income-levels of customers, and therefore a resulting decrease in demand, could be a challenge for them in maintaining their businesses in the next six months. However, businesses did not commonly anticipate that demand for what they provide would decrease in coming months for other reasons.

Business expansion: interest, cost, and challenges

Overall findings show a very strong interest in business expansion among Dana businesses; more than half of surveyed businesses reported that they already had concrete plans to expand and more than a quarter reported that they were interested in expanding but had no set plan to do so. When asked in which terms they would be most interested to expand, half of the interested businesses prioritised expansion of physical space for their business. Of the 17 businesses operating without a physical store front or central facility, 16 were interested in expansion and 8 prioritized expansion of physical space, indicating that support for securing store fronts or production spaces would be welcome.

Echoing earlier findings that tools and productive assets are priority resources elements for almost all business sectors, nearly half of the businesses who expressed interest in expansion noted that they were interested in acquiring new tools, machinery and other assets to support expansion. Only 4 assessed businesses (1%) reported that they would hire additional employees as part of business expansion; these were 2 micro and 1 medium commercial retail/trade businesses and 1 medium agricultural processing/food production businesses. While only reported by a handful of businesses, this indicates that commercial retail/trade in particular may be a good target for employment/employability schemes in Dana.

Figure 29: Interest in business expansion (by % of assessed businesses)

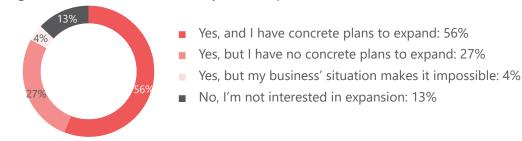

Figure 30: Type of expansion most desired (by % of 305 assessed businesses who expressed interest in expansion)*

Expansion of business' physical space	50%	
Acquisition of new tools/machinery/other assets	49%	
Hiring of additional staff	1%	

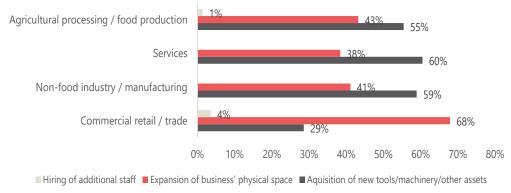

Respondents could select more than one option and therefore findings exceed 100%.

Overall, trends were relatively consistent across all sectors in terms of interest in business expansion. A vast majority of businesses in the agricultural processing/food production sector (94%), services sector (94%) and non-food industry/manufacturing sector (83%) reported that they were interested in business expansion, primarily through acquisition of new tools, machinery, and other assets (see figure 31).

On the other hand, 68% of businesses in the commercial retail/trade sector reported that they were interested in expanding their business through expansion of businesses' physical space (see Figure 31), likely due to need for more storage space for increased inventory and/or requirement of a bigger store front to conduct retail activities.

Figure 31: Type of expansion most desired by sector (by % of 305 assessed businesses who expressed interest in expansion)*

As noted previously, out of those businesses that expressed an interest in expansion, 56% of businesses reportedly had concrete plans for expansion. These businesses were asked to provide an estimate of the cost of planned expansion, irrespective of type and scope, in order to understand the typical overall costs associated with business expansion in each sector, also understanding that costs may vary based on the size of businesses and the type and scope of planned expansion.

As displayed in Table 6, median expansion costs across sectors range from 2,000 USD to 6,000 USD, with service sector businesses representing the low end and non-food industry/manufacturing at the high end. These expansion cost estimations provide critical information and insights into what businesses require for future continuity and expansion, and could potentially inform decisions around MSME grant support values specifically for business growth in Dana. However, a more detailed breakdown of cost in relation to the specific desired expansion activities would provide response actors a better indication for setting guidance around such values.

Table 6: Median estimated cost of planned expansion by sector (of 197 assessed businesses who reported having a concrete plan for expansion)

Sector	TRY	USD
Agricultural processing/food production	60,000	3,206
Services	37,430	2,000
Non-food industry/manufacturing	112,291	6,000
Commercial retail/trade	75,000	4,007

Among the challenges that businesses felt could potentially deter or prevent expansion, a large majority highlighted a lack of financial resources as the main barrier. This is in line with the reported businesses priority needs where surveyed businesses reported that financial support was the top priority support need for their activities (see pg. 21).

In the absence of formal financial institutions and channels for businesses to access loans, MSME grant support can not only help businesses to maintain their operations but also support businesses to expand. Such expansions could contribute to improving the overall economic conditions in the area but additionally, also create more jobs for populations, therefore improving employment and livelihoods opportunities for all.

Figure 32: Reported challenges that could deter or challenge businesses from expanding (by % of assessed businesses)*

There is a lack of money to expand	85%	
No need to expand, my business meets the demand	12%	
Insufficient demand for what the business provides	3%	I

KEY DEFINITIONS

Sectors		Furniture	Expenditures on items such as tables, chairs, desks, shelving, mirrors,	
Agricultural processing/food production	Agricultural processing businesses take raw agricultural outputs like wheat or livestock and change them into consumer products. Food production businesses are similar but are focused on the production of ready-made food products through adding additional inputs. This sector did not include farming or harvesting due to existing information available on the cost of inputs for such businesses in North Syria.		display stands, that are used to make a space suitable for a business's operations. This does not include productive assets that a business requires in order to perform work and generate profit (see productive assets, tools appliances).	
		Inputs	Expenditures on items, ingredients, raw materials, packaging, etc. that are intended for use in a business's production or provision of services, but not for direct sale to customers.	
Commercial retail/ trade	Retail businesses are those that sell products directly to consumers. This category also includes wholesalers, distributors, and importers who sell products to businesses and are involved in the process of getting products	Inventory	Expenditures on items that are intended for direct sale to customers.	
	to their end destination. Marketing and		Expenditures on signboards, advertisements, flyers, communication	
Non-food industry/ manufacturing	Businesses that aid other businesses in manufacturing, shipping or producing their products. Products and services of this sector go to other	advertising	campaigns, and other items or services designed to raise awareness of a business's work among potential customers.	
	businesses, not directly to consumers.	Office supplies	Expenditures on items that are intended to support the smooth functioning of a business, but are themselves not directly related to its work (pens,	
Services	Provision of services as opposed to goods or product production, for example transportation, training, consulting, health care, financial services.		paper, cleaning supplies).	
Assessment terminolo		Productive assets, tools, appliances	Expenditures on items directly connected with a business's main line of work and its efforts to generate profit (farming equipment, machinery, stoves, refrigerators, computers)	
		Rent and land tenure	Payments made to a land-owner, building owner, or similar actor in order	
Micro, small, medium enterprises (MSMEs)	Local definitions of MSMEs vary from country to country. Based on the context in north Syria and for the purposes of this assessment they were defined as follows based on the number of employees they report (including owners) – micro: 1-3 employees; small 4-10 employees;	Kent and land tenure	to secure a business's right to occupy its land and/or facilities. This does not include the cost of constructing new buildings or of maintaining existing ones.	
	medium: 11-50 employees.	Salaries and wages	Payments made to a business's employees to compensate them for their	
Start-up costs	The total value of all the productive assets, tools, appliances etc. needed to establish the business and grow it to its current size.		labour, no matter how often these payments are made (daily, weekly, monthly, seasonally, on commission). This includes the owner's salary.	
		Services	Payments made to external providers for services required to enab	
Recurring costs	Costs incurred on a recurring basis. For this assessment these were taken as a monthly average from the past three months		business to function (software licenses, insurance, legal services) or to k a business facility running smoothly (cleaning, maintenance, repairs).	
One-off costs	One time expenditures. For this assessment these were those incurred in the past 12 months.	Taxes, regulation, documentation	Payments made to governments, local authorities, trade unions, etc. to ensure that a business is legally compliant and has all the permits and other documentation necessary for it to operate.	
Expenditure categories		Transportation and travel	Expenditures incurred in the process of moving products, inventory, assets	
Construction	Expenditures incurred in the process of constructing new facilities or expanding existing facilities for a business, including the cost of labour and construction materials.	uavei	or employees from one place to another as part of a business's operations (for example, bringing goods to a marketplace, arranging shipments of inventory or inputs, delivering products to customers.	
		Utilities	Payments made to external providers to secure a business's access to electricity, water, fuel, phone services, internet services, trash collection, and other basic services that help a business to function and to keep its facilities comfortable for employees.

ABOUT REACH

REACH Initiative facilitates the development of information tools and products that enhance the capacity of aid actors to make evidence-based decisions in emergency, recovery and development contexts. The methodologies used by REACH include primary data collection and in-depth analysis, and all activities are conducted through interagency aid coordination mechanisms. REACH is a joint initiative of IMPACT Initiatives, ACTED and the United Nations Institute for Training and Research - Operational Satellite Applications Programme (UNITAR-UNOSAT).

For more information please visit our website: www.reach-initiative.org. You can contact us directly at: geneva@reach-initiative.org.

Feedback on improvements to this product can be done anonymously using the following link.
