1. Rationale

2.1 Rationale

Agricultural drought was highlighted as a severe hazard based on early findings from the EU's Instrument for Stability and Peace for Resilience building in the Sea of Azov area. Drought severity was determined as high across the Sea of Azov area (ASA), including Kherson oblast impacting livelihoods, and land degradation in a large agricultural producing region of Ukraine. According to a [study](#) by the World Resources Institute (WRI) in 2021, Ukraine and Moldova have the highest risk of drought in the world, following by Bangladesh, India, and Serbia.

Geographically the steppe zone, which includes Kherson oblast, is characterized by predominantly arid conditions, and suffers the greatest impacts from droughts. Over the last 20 years, Ukraine has experienced several major droughts, including in 2003, 2007, 2012, 2017 and 2020. In some years, the negative impact of drought is also exacerbated by a dry autumn and abnormally warm low snowfall winter in the previous year, such as in 2007. The ongoing agricultural drought – impacting the Kherson oblast – has the potential to exacerbate existing tensions related to water supply, erode local populations' socio-economic coping capacity, and provoke increased wildfires (+7% in 2020).

Additionally, the climatic trends identified by Supporting greater socio-economic resilience in the Azov Sea project, conducted by IMPACT initiatives in 2021, clearly indicate rising temperatures and falling precipitation across the region, which could result in increasing frequency of droughts in the future². There is a clear trend between annual precipitation and drought seasons, with abnormally low precipitation observed in years of identified drought.

² Data on climatic trends for this project was taken from [GLDAS Noah Land Surface Model L4](#)

Considering current drought risk and future scenarios of increasing the frequency and severity of drought in southern part of Ukraine, immediate drought mitigation strategies are needed.

This Drought Risk Mitigation Assessment in Kherson will enable IMPACT to understand current mitigation efforts, mitigation best practices, as well as challenges and barriers in implementation of best practices in order to inform local authorities and implementing partners' strategy for mitigation efforts and investment. To achieve that, IMPACT will conduct the survey within both enterprises (micro, small and medium farms only) and a sample of households that grow their own crops in rural areas.

2.2 Intended impact

Through this assessment, IMPACT seeks to provide a comprehensive overview of the drought impact on households and MSME and predominant mitigation measures undertaken by them, focusing on the hromadas most affected by drought within Kherson oblast. Information products will be useful to the below stakeholders in the following ways:

- **National and local government actors:** Survey analysis and final report will help to inform local authorities and implementing partners' strategy for mitigation efforts and investment
- **Humanitarian and development actors:** The final report may be used in identifying main concerns of local household and MSME and provide an evidence base for drought mitigation policies and future programming.
- **Donors:** The final report may assist in shaping future funding priorities for drought risk mitigation in Sea of Azov region.

2. Methodology

3.1. Methodology overview

This Drought Risk Mitigation assessment will be comprised of two surveys (KI and HH component) conducted by IMPACT from 27th October till 15th December 2021. The first survey aims to collect, process and analyse interviews from 412 randomly-selected households (aiming for 95% confidence, 7% margin of error), followed by a survey of approximately 400 purposefully sampled MSME owners, managers or their representatives.

The household (HH) survey will be focused on the assessment of eastern and southern hromadas of Kherson oblast, which geographically also connected to Crimea peninsula.

The HH sample will be stratified between 'Moderate' (9 hromadas) and 'Severe' (6 hromadas) drought-affected settlements, across the 15 hromadas mentioned in Table 1 and visualised on the Map 2 in Annex 1. However, the sampling frame will only comprise of rural settlements within these hromadas to include households that have access to agricultural lands and grow their own crops. The findings from the household survey would thus only be representative of settlements included in the sampling frame. 206 interviews in rural settlements will be collected in Moderate drought strata. Another 206 interviews will be collected, representing Severe drought strata. Hromadas for HH survey were selected according to [drought index](#), (see the Map 1 in Annex), mean precipitation during vegetation season 2020 ([CHIRPS database](#)) and [heat wave index](#) derived from satellite data. Other criteria was the percentage of arable lands within a hromada, which should exceed the 50% from the total area (See Table 1)

The HH survey will identify socio-economic characteristics of HHs, drought impact and the drought mitigation measures undertaken by interviewed households.

Table 1: Strata selection criteria for HH survey

nn	Hromada Name	Rural population (2001)	Number of settlements	Precipitation over vegetation season of 2020 (mm)	Percentage of heat wave days over 20 years	Drought Index (VCI) Mean	Percentage of arable lands, %
	Severe drought strata						

1	Nyzhnosirohozka	13797	24	6,17	24,00	7,16	91

14	Kalanchatska	10146	14	5,72	14,24	8,21	56
15	Kakhovska	9155	5	6,28	10,16	8,94	62

Source: Population – [Census, 2001](#); Drought Index – [Modis VCI index](#); Precipitation – [CHIRPS database](#); Percentage of heat waves – [Modis Land Surface Temperature](#).

As for MSME survey, 400 interviews will be conducted with MSMEs owners, managers or their representatives registered on the whole area of Kherson oblast. This survey will be based on purposive sampling of MSMEs contacts of which were taken from the enterprise registration lists maintained by the Government of Ukraine and collected on request from local authorities (hromadas). MSME survey will help to explore the drought impact, drought mitigation measure as well as barriers and opportunities for better integration of drought mitigation activities.

Open geospatial data sources from a variety of sources (both national and global) will also be used to improve mapping of drought hazards and exposure in the assessed areas. In addition, primary data from the survey as well as secondary statistical data on local levels will be utilized to assess social-ecological vulnerability to drought on the assessed area (Kherson oblast)

3.2 Population of interest

Drought Risk Mitigation assessment will focus only on rural population that grow their own crops in Kherson oblast. Data will be collected on household³ level and interviews will be conducted with heads of HH or people who can speak on behalf of the head of HH. The primary reasoning behind focusing on HH that grow their own crops, is that many of HH have agriculture as primary source of income and foods production for their households. And most of these households are living in rural areas. Therefore, drought hazard may lead to the HH's economic instability and food insecurity. For KI component, enterprises (micro, small and medium farms),

³ Household (HH) - a set of persons who live together in one dwelling or part of it, provide themselves with everything necessary for life, run a joint household, fully or partially combine their funds, and spend them.

purposefully selected from those, registered on the same area will be considered. The population of interest for the enterprise survey includes micro, small and medium farm enterprise owners, managers or their representatives in the assessment area.

3.3 Literature and Secondary data review

Following global and national informational products will be considered for LSDR.

3.4 Primary Data Collection

Household survey

The household survey will comprise of 412 interviews (including 12 buffer interviews) with randomly-selected households who live in rural areas and grow their own crops across 2 strata in 15 assessment areas (See Table 2). The survey will collect data to gain an understanding of drought impact on household's and the drought mitigation measures undertaken by them. The overall household survey sampling strategy will seek to achieve 95% confidence and 7% margin of error for household level reporting within each strata. Random selection of households will be achieved using geospatial sampling methods by which interviews within each strata level will be distributed across settlement area using a population distribution raster and rectangular grid network covering the entire settlement. The number of interviews per rectangle will be distributed using an R sampling script and the population distribution raster (LandScan 2019 - <https://landscan.ornl.gov/>), which define probability of interview distribution (more densely populated areas of the settlement get a greater number of interviews). At the start of each day of data collection, enumerators will be distributed equally within rectangular grid network covering the entire settlement. However, due to COVID-19 restrictions in the region, heads of household will be offered alternative ways to conduct a survey. It would be possible to conduct either a face-to-face interview immediately

with all required hygiene regulations or HHs' contacts will be collected, and phone interview will be conducted with them afterwards.

Selection criterion for HH survey is HH grows crops. At the beginning of survey enumerators will ask if respondent's HH grows crop, and if not – it will be considered not suitable for the survey. To keep the randomisation intact, the following steps apply: if the random sampling GPS points is located either in area without living buildings or in proximity to the area with security concerns, then the enumerator attempts to find another closest spot with presented possible respondents within the same rectangle. If there is no such spot within this rectangle, then enumerator tries to find it in the neighbour rectangle.

To counteract potential sampling bias related to household selection, interviewing will be conducted throughout the week, including on the weekend and where possible into the evening to ensure that economically active households have an equal chance of selection.

Table 2. Strata for the Household Survey

Strata	nn	Hromada Name	Sampled population (2001)	Sampled settlements	HH surveys (including buffer interviews)
Severe drought strata	1	Nyzhnosirohozka	11304	16	28
	2	Henicheska	22132	26	67
	3	Rubanivska	4940	3	14
	4	Chaplynska	7260	9	14
	5	Ivanivska	8590	14	25
	6	Novotroitska	22261	27	58

	13	Liubymivska	2109	2	5
	14	Kalanchatska	9637	11	32
	15	Kakhovska	9155	5	38
Total	15		135 842	162	412

Enterprise survey

Approximately, 400⁴ enterprise surveys will be conducted with the owners or managers (or their representatives) of MSMEs registered in Kherson oblast. Due to non-probability sampling strategy, findings from KI survey will be indicative. The enterprise survey will capture key characteristics, explore the drought impact, drought mitigation measure as well as barriers and opportunities for better integration of drought mitigation activities.

The enterprise survey will be conducted through both telephone, online forms, and face-to-face interviews where possible with enterprises purposefully sampled from the enterprise registration lists maintained by the Government of Ukraine and collected on request from local authorities (hromadas). As most of the interviews will be conducted by telephone relying on available contacts data base of MSMEs in Kherson oblast, it is hard to predict the geographical stratification of successful interviews. However, efforts will be made to capture as many areas as possible, to ensure diverse range of enterprises have been covered through the survey. The following business types within the whole oblast will be included:

- Micro, small and medium enterprises
- State-run and private enterprises
- Currently operational enterprises

3.5 Data Processing & Analysis

Primary data will be entered into Excel instantaneously from Kobo. During primary data collection, the Data Officer and AO will review data daily to ensure collection methodology is being followed by enumerators and investigate any outliers or other problematic data, including ensuring random sampling is being carried out in accordance with the sampling plan.

The Data Officer will keep a log of any changes, including cleaning of data. All data cleaning will be done in line with IMPACT's [Data Cleaning Minimum Standards Checklist](#). Clean data will be analysed using Excel and R software.

Both the household and enterprise survey data will be cross-tabulated by geographic strata and key analysis variable, with significance testing carried out within each cross tabulation. The following tabulations are planned:

Household survey

HH characteristic:

- Source of main income

Geographic variation between:

- Strata

Enterprise survey

Geographic: location of the field (hromada)

Variations by scale of enterprise (micro, small and medium)

4. Key ethical considerations and related risks

The proposed research design meets / does not meet the following criteria:

<i>The proposed research design...</i>	<i>Yes/ No</i>	<i>Details if no (including mitigation)</i>
... Has been coordinated with relevant stakeholders to avoid unnecessary duplication of data collection efforts?	Yes	
... Respects respondents, their rights and dignity (<i>specifically by: seeking informed consent, designing length of survey/</i>	Yes	

⁴ This target is based on the maximum possible with the available budget. This number was considered as sufficient to collect the information about the practices applied in the region.

discussion while being considerate of participants' time, ensuring accurate reporting of information provided)?		
... Does not expose data collectors to any risks as a direct result of participation in data collection?	Yes	
... Does not expose respondents / their communities to any risks as a direct result of participation in data collection?	Yes	
... Does not involve collecting information on specific topics which may be stressful and/ or re-traumatising for research participants (both respondents and data collectors)?	Yes	
... Does not involve data collection with minors i.e. anyone less than 18 years old?	Yes	
... Does not involve data collection with other vulnerable groups e.g. persons with disabilities, victims/ survivors of protection incidents, etc.?	No	For HH survey we also consider such vulnerable groups as older people (pensioners) and people with disabilities if they agree to conduct the survey on behalf of the household. Enumerators have been instructed and trained to work with older people by Help Age organisation and with people with disabilities by Chemonics International.
... Follows IMPACT SOPs for management of personally identifiable information ?	Yes	

5. Roles and responsibilities

Table 2: Description of roles and responsibilities

Task Description	Responsible	Accountable	Consulted	Informed
Research design	Assessment Officer	Research manager	DRR unit, Data team, GIS ⁵ team, CFP ⁶ , HQ ⁷ (IMPACT Research Design and Data Unit (RDDU))	Donor
