General Objective	To provide accurate and up to date information on NFI availability, accessibility and affordability, as well as shelter conditions across the whole of Syria. The information obtained will inform the Humanitarian Needs Overview 2019 and support S/NFI Cluster members' programming through an improved sectoral understanding. The assessment will also aim to gain a greater understanding of the context of S/NFI needs, by comparing findings to previous S/NFI assessments.				
Specific Objective(s)	<p>The specific objectives of the education assessment are to identify and assess:</p> <ol style="list-style-type: none"> 1. Current Shelter and NFI needs of households across accessible areas of Aleppo, Ar-Raqqa, Deir-ez-Zor, Hama, Homs, Idleb, Dar'a and Quneitra governorates. 2. Disparities in needs between areas assessed, with regards to shelter and NFIs. 				
Research Questions	<ol style="list-style-type: none"> 1) What is the current shelter adequacy and status of populations living in Syria? 2) What are the shelter needs of populations living in Syria? 3) What is the current availability and access to NFIs of populations living in Syria? 4) What are the NFI needs of populations living in Syria? 5) Are there disparities in the shelter/NFI situation and needs of populations living in different areas across Syria, between governorates, sub-districts and urban/rural areas?

2. Rationale

Since the beginning of the crisis in March 2011, conflict has caused 5.5 million Syrians to flee to neighbouring countries and further abroad. Within Syria, 6.1 million people have been internally displaced, and an estimated 13.1 million are in need of humanitarian assistance. The volatile security and access situation within the country impacts NFI availability, accessibility and affordability, as well as shelter conditions across the whole of Syria. While an estimated 4.7 million are in need of assistance in regard to NFIs, 4.2 million reportedly require assistance in regard to shelter (Humanitarian Needs Overview (HNO) 2018). Furthermore, the ability to provide adequate response is hindered by the limited information on humanitarian needs and vulnerabilities.

In order to strengthen the sectorial evidence-based approach, REACH will build upon the first and second comprehensive SNFI assessments carried out in December 2016 and September 2017, by implementing a third assessment round of data collection and analysis on behalf of the Office of the United Nations High Commissioner for Refugees (UNHCR) and the Shelter Cluster. This assessment will take place across accessible opposition-held areas in the Governorates of Aleppo, Ar-Raqqa, Dar'a, Deir-Ez-Zor, Hama, Idleb, and Quneitra, collecting information on NFI availability, shelter conditions and status of households. Data collection for the Shelter/NFI and Injury and Disability assessment will be coordinated in areas of overlapping coverage.

In addition, the findings will be analysed to develop relevant governorate profile factsheets, a comprehensive report as well as a dashboard. The findings will be used to inform relevant decision makers and external stakeholders, providing these actors with information to inform response planning, programme development and proposals, advocacy materials, and increase general awareness of the important S/NFI issues and provide up-to-date data to inform the HNO 2019.

3. Methodology

3.1. Methodology Overview

The assessment will use a mixed methodology to gather data on as wide an area as possible – reaching both directly accessible and remotely accessible areas – using REACH enumerators. Where access and security allow, data will be collected directly through randomly selected household interviews in 50 sub-districts. Where this is not feasible, specifically in Deir-ez-Zor and areas of Hama, Idleb, and Aleppo governorates, Key Informant (KI) interviews with purposively sampled members of the community will be the primary method of data collection for 19 sub-districts.

3.2. Population of Interest

The household and KI level assessment focus on all populations in opposition-controlled areas of Syria, including IDPs in camps, informal sites and host communities, informal sites and host communities, as well as spontaneous returnees and host communities/resident pre-conflict populations. Adult heads of households and KIs ages 18 and over will be interviewed.

3.3. Secondary Data Review

REACH will refer to the ISMI, HNAP, HSOS and CCCM population task force consolidated population numbers list for the most up-to-date population figures to inform the sampling frame. Primary data will also be triangulated with secondary data from available sources to verify the accuracy of SNFI information gathered.

3.4. Primary Data Collection

Directly accessible areas

For areas where administration of household-level surveys is possible, interviews will be conducted to allow findings to be representative at the sub-district level with a 95% confidence level and a 10% margin of error. At the governorate-level the sample will be representative with a 95% confidence interval and a maximum margin of error of 5%.¹

¹ The wording 'maximum' here is to convey that while the margin of error is set at 5%, governorates with higher a number of subdistricts will have a lower margin of error.

Household interviews

Where household-level data collection is possible, random household sampling will be implemented to generate a statistically significant stratified sample designed to allow findings to be representative at the sub-district level with a 95% confidence level and 10% margin of error. As such, approximately 101 household interviews will be conducted in each sub-district. Furthermore, during data analysis, weighting will be conducted for any aggregated results, to account for the fact that a household in a smaller sub-district will be more likely to be selected across the entire area assessed; this will allow results to be representative at the governorate level with a confidence level of at least 95% and maximum margin of error 5%. Findings at the governorate level will only be generalisable to the sub-districts included in the sampling frame. The targets for the household surveys for each governorate are as follows:

Governorate	Number of surveys	Sub-districts Assessed
Aleppo	327	3
Ar-Raqqa	792	6
Dar'a	1,191	12
Hama	101	1
Idleb	2,561	24
Quneitra	379	4
Total	5,347	50

The sampling strategy will have two scenarios: 1) two-stage random sampling and 2) cluster sampling.

The primary method will be to conduct a two-stage random sampling. Within each sub-district, two-stage random sampling stratified at the subdistrict level will be implemented to randomly generate communities to assess, and the number of households to survey in each community. This will be done by creating a list of all directly accessible communities which will have the number of households for each community. Using a sampling tool built in R, this list will be stratified by subdistricts and will produce a sampling frame comprised of the communities that will be assessed in each subdistrict.

Communities in this sampling frame are randomly selected based on the proportion of the number of households to that of the total number of households of the subdistrict.² For each randomly selected community the sampling calculation will also output the number of households that must be sampled in order for the results to be representative at the subdistrict level. The probability that a community is selected, as well as the number of surveys to conduct per community, will therefore be influenced by the comparative number of households of community; this ensures that all households within the sub-district have the same probability of being selected for the survey.

If the two-stage random ramping generates a sampling frame where a sub-district has more than 20 communities to be assessed (10 sub-districts in total), those sub-districts will be resampled using cluster sampling, with a cluster size of 5. Using this strategy, the number of surveys conducted will be proportional to the number of households within the cluster. This is because assessing more than 20 communities in a sub-district would not be feasible (due to travel time and other logistical constraints) for enumerators to reach the target number of surveys for a sub-district. To account for the design effect of cluster sampling, a higher number of surveys will be collected in these sub-districts to meet the same confidence level and error margins as the sub-districts where two-stage sampling is used. The cluster sampled sub-districts will also be adjusted for design effect in the analysis stage. Lastly, as the target precision of the household data collected using cluster and two-stage sampling will be the same, this data can be aggregated together at the governorate level and can be compared between sub-districts.

Remotely accessible areas

For areas in which data will be collected through KI interviews, 305 surveys will be conducted at the community level in each sub-district and reported at the sub-district level during analysis. We aim to survey all accessible communities in each remotely assessed sub-district for the findings to be representative, but because KIs will purposely selected we cannot generalize with a quantified level of precision. The aim of KI interviews will be to cover areas that are not directly assessable, to ensure a wider coverage area. KIs will be selected based on existing networks and snowballing. A KI will be selected on the basis of relevant shelter/NFI knowledge.

² Proportional to Population Size method
www.reach-initiative.org

Key informant interviews

In each sub-district, an average of 17 KIs will be assessed. The exact number of KI interviews will depend on the size of school-aged populations in the communities in the sub-district. The aim will be at least 1 KI reporting on each community. To account for difficulties reporting across large communities, where a community is larger than 20,000 people, a greater number of KIs will be interviewed and their responses aggregated. The rule used for the number of KIs per community is as follows:

Community size	Min number of KIs
0–20,000	1
20,000–40,000	2
40,000–60,000	3
60–80,000	5
80,000 +	6

A total of 305 KI interviews will be conducted in remotely accessible areas at the community level in each sub-district and reported at the sub-district level during analysis, although (as is typical with KI interviews) findings will be indicative rather than representative of either the community or sub-district. The alternative option of having KIs report at the sub-district level is not preferred as it is difficult for KIs to report on the larger geographical area due to a lack of detailed knowledge of multiple communities.

3.5. Data Processing & Analysis

Data will be entered and cleaned daily. Daily checks and follow-up will take place to address errors and outliers in data entry. Lastly, data cleaning logs and the respective raw data will be kept for both survey types.

Household survey data will be aggregated to the sub-district and governorate levels. While aggregations of the household surveys to the sub-district level will be representative, it will be necessary to weight the sub-districts when aggregating to the governorate level. Weighting coefficients will be proportional to the population sizes of the sub-districts that comprise a governorate. In analysing the data, responses from household surveys will be weighted based on the number of households surveyed in a sub-district relative to the number of households in that-subdistrict.³ This ensures that results are aggregated to the sub-district and governorate levels, they are not skewed by the methodological differences in number of surveys collected per household in different sub-districts.

The type of KI will be recorded during each interview. Different types of KIs are assumed to have better knowledge to the answer questions related to SNFI than others. For example, a KI working as a local relief worker or construction worker can accurately assess the SNFI needs in their own community, and thus their responses to questions may be considered more trustworthy than those of other KIs. At the community level, when multiple KIs were interviewed in a community, the most common response to the KI surveys (in that communities) categorical variables will be selected. If there are conflicting responses and no clear “most common” response, in the case of categorical variables, a KI confidence level (CL)⁴ based on the type of KI will be applied when triangulating the data from several KIs.⁵ Therefore, for the KI data, for categorical variables, if multiple answers are found to have the same top score, the answer with the highest individual confidence level (CL) is retained.

For numerical variables in the KI data, at the community level, the value of the variable will be calculated by multiplying the values by the CL.⁶ This new value will be used to report at the sub-district and governorate level.

Data will be processed using a combination of statistical analysis tools and Excel, with visualizations created using Excel, R, Tableau, and ArcGIS.

³ The formula used in weighted weighting by REACH is $(A/B) / (C/D)$ where A is the total HH in the sub-district, B is total HHs in assessed sub-districts, C is the number of HH assessed in the sub-district and D is the number of HHs assessed in the country.

⁴ KIs of each type are assigned a confidence level (CL) of 1 to 3, with a score of 3 indicating that they are among the most likely community members to be able to provide accurate information. Confidence levels for each KI type were nominated independently by REACH teams.

⁵ This is in line with recommendations made by an evaluation of data management practices implemented during the 2014 Syria Multi-Sector Needs Assessment – specifically regarding the need to retain data

⁶ See Annex 6

KI community-level interviews

Furthermore, household surveys will not be feasible across all areas due to security constraints. Indicative coverage suggests direct access is possible in parts of Idleb, Aleppo, Ar-Raqqa, Deir-ez-Zor, Hama, Dar'a and Quneitra with remote coverage and alternative methodologies required for parts of Hama, Idleb, Aleppo and all of Deir-ez-Zor governorates in remotely accessible areas. The data collection method for each governorate is subject to change depending on the security situation during the period of data collection. In these areas, either remote or direct KI interviews will be conducted instead. Community representative profiles will be agreed in collaboration with UNHCR and the S/NFI Cluster to ensure that adequate confidence levels are attributed to responses depending on the KI profile. To achieve this KIs will be selected based on their knowledge of shelter and NFI issues and will be instructed to answer questions at the community level. KI responses pertaining to estimates about percentages of a population will also be weighted using the same formula at the HH level. KI interviews will also be used to triangulate and contextualise findings from the HH survey.

Data collection

As direct household data collection is not feasible across the entirety of the area covered by this assessment, a mixed methodology approach is adopted based on the coverage mapping outlined above. For governorates where safety and security considerations permit, household surveys will be conducted, while in governorates where security does not allow for household surveys, direct or remote KI interviews will be conducted, depending on whether it is safe for enumerators to conduct direct interviews. Data collection for northern governorates will be led from Turkey and northeast Syria, while data collection in southern governorates of Dar'a and Quneitra will be led by the REACH team based in Jordan. Data collection will be coordinated and supervised from Amman. For areas in which KI interviews are the primary method of data collection, enumerators will directly interview KIs and enter data either directly onto smartphones using the Kobo Collect platform, or onto paper forms to be transferred to Kobo afterwards, depending on the security situation.

Where possible, all data collection will be undertaken by mixed-sex teams to enable access to all sampled respondents and ensure gender sensitive contextualisation of findings during enumerator de-briefings. However, this may not be possible in many assessed locations due to security constraints.

Data checking and cleaning

Data will be cleaned and checked throughout the data collection period. A data cleaning log will be implemented and continually updated during data collection to minimise data cleaning efforts following the completion of data collection. Upon completion, a final round of data cleaning will be conducted to finalise the data set to be shared with UNHCR. Data cleaning will involve continuous follow-up with field teams to clarify and correct any discrepancies. As outlined above, a data analysis plan is established during the preparation and planning phase, allowing for findings collected through household surveys to be disaggregated by sex, shelter type and location. KIs will be analysed through agreed confidence levels.

Immediately following completion of data collection, a final review of data will be undertaken to identify any errors, recode and translate entries. Assessment teams will conduct outlier checks, analysis of 'other' responses, identification and removal or replacement of incomplete or inaccurate records, and recoding and standardisation of entries.

Data Analysis Plan

Once the SNFI datasets have been cleaned, preliminary analysis for the SNFI data will be conducted according to the analysis plan to be developed in collaboration with UNHCR. Analysis will be conducted using a combination of SPSS and Excel, with additional data visualisation using Tableau and GIS mapping software. For aggregation, individual household survey records will be assigned a weight at the sub-district level based on the population of that sub-district (i.e. weighting coefficient = number of people represented per record = sub-district population/number of records in the sub-district). For aggregation of KI records to the sub-district and governorate levels, the most common categorical variables will be identified and reported on, and when no "most common" response can be identified, the response from the KI with the highest CL will

be selected.⁷ For numerical values, the KI CL, will be multiplied by the numerical value.⁸ This value will then be used to report at the governorate level.

Primary data will be triangulated with secondary data from available sources, to verify the accuracy of information gathered. Once preliminary analysis has been finalised, a presentation of findings to partners (UNHCR and the Shelter / NFI cluster) will occur in the North and South hubs, along with a joint analysis workshop with South hub cluster members in Amman, to allow further contextualisation of findings and gain feedback on additional analysis required. This will result in the production of the specified final outputs.

Annex 4: Resources and Workplan

6.1. Resources: HR, Logistic and Financial

In terms of resources mobilisation:

- Enumerators will be hired on temporary contracts, fitting with data collection timelines.
- The project will have HR, logistical and financial support from ACTED/REACH offices based in Amman, Jordan, as well as ACTED/REACH offices based in Turkey and KRI.

6.2. Work plan

Insert work plan in ToR when completed (see shared drive for attached excel).

Annex 5. Risks & Assumptions

Table 3: List of risks and mitigating action

Risk	Mitigation Measure
Potential inaccessibility of particular sites due to security constraints.	Security situation will be monitored up to the start of data collection with a clear back-up plan allocating enumerators to collect data from other areas; if the security situation subsides data can be collected at a later point in the data collection period. If it is not possible to gather data from certain locations, analysis will make clear that these locations are excluded when generalising findings across the area. The cluster will be notified and consulted throughout. If a sub-district where a household survey is planned is no longer possible to access, the methodology in that particular sub-district will switch to KI interviews.
Security situation results in travel time to certain areas being increased.	The security situation will be continually monitored and alternative routes identified.
It is not possible to obtain approvals to collect data from certain areas.	Approvals are only required for specific areas such as Al-Hasakeh governorate.
Randomly selected sample of households generate non-responses.	Ensure overall sample contains a 10% buffer, with the aim to survey 10% more respondents than needed to reach the target sample size.
Interviewees in some areas are unwilling to participate in the assessment	The survey is anonymous and entirely voluntary, and all households will have the right to withdraw. Survey questions will respect humanitarian protection guidelines and enumerators will emphasise the importance of the assessment when approaching households. If households are unwilling to participate, enumerators will be instructed to move on and find other interviewees.

Annex 6. KI Confidence Level

Continuous variables

With continuous variables, this is reflected in an aggregated value that is closer to the value provided by the KI with the highest CL:

$$\frac{(KI1 \times CL1) + (KI2 \times CL2) + (KI3 \times CL3)}{(CL1 + CL2 + CL3)}$$

- Example: Estimated minimum number of IDPs arriving in the village/neighbourhood during the previous month?

$$\text{Example: } \frac{(10,000 \times 1) + (25,000 \times 1) + (100,000 \times 3)}{(1+1+3)} = 72,500$$

Categorical variables

With **categorical variables**, the most common response will be selected. When the “most common” response cannot be identified, one of the three following scenarios depending on how many categories can be selected for a question:

• Select one

- **Example:** On average, over the past three months, has average rent in the community increased, decreased or stayed the same?

Answers from the different questionnaires are aggregated by identifying the answer provided 1) most often and 2) with the highest confidence level.

The following steps are used to aggregate records from multiple participants into one community- or neighbourhood-level record:

- Create binary variables for each of the categories (for instance, 1 = True or Yes, 0 = False or No).
- Replace the ‘1’ in each binary variable with the value of the confidence level that was assigned to each response (for instance, if a KI answers “True” to a question for which they have been assigned a confidence level of 3, their “True” response for that question would be assigned the number 3).
- Sum the confidence level scores for each category of responses to identify the category with the highest score.
- Assign the category with the highest score to the community-level record.

If multiple answers are found to have the same top score, the answer with the highest individual CL is retained.¹²

• Select top 3

- **Example:** What are the top 3 NFI needs of the following groups in your community?

Answers from the different questionnaires will be aggregated by identifying the top 3 categories that were provided most often and with the highest confidence level.

The following steps will be followed to aggregate individual records into one village level record:

- Create binary variables for each of the categories (for instance, 1 = True or Yes, 0 = False or No).
- Replace the ‘1’ in each binary variable with the value of the confidence level that was assigned to each response (for instance, if a KI answers “True” to a question for which they have been assigned a confidence level of 3, their “True” response for that question would be assigned the number 3).
- Sum the confidence level scores for each category of responses to identify the categories with the highest scores.
- Assign the categories with the 3 highest scores to the community-level record.

If more than 3 categories are found to have identical scores, the answers with the highest individual CLs are retained.¹³

• Select all that apply

- **Example:** What are the most common adequacy issues faced?

Answers from each submitted questionnaire should all be retained in the final aggregated village level record.

Subdistrict-level or higher aggregation

When presenting results at sub-district levels or above, the average confidence level of KIs reporting on each individual variable within that area is declared. Weighting is not conducted unless a representative sample of villages would be obtained for a sub-district or above, since it might otherwise risk misrepresenting the results.
